TRIP GENERATION COMPARISON, SITE ACCESS AND VMT ANALYSIS FOR THE RICHARDS RANCH PROJECT, SANTA BARBARA COUNTY

Associated Transportation Engineers (ATE) has prepared the following trip generation comparison, site access and VMT analysis for the Richards Ranch Project. The study updates the previous analysis completed by ATE for the Project based on the updated Project statistics.

INTRODUCTION

ATE previously prepared a traffic, circulation and VMT study for the Richards Ranch Project that was proposed for annexation to the City of Santa Maria (the "2024 Santa Maria Project"). ATE also completed additional trip generation estimates for the 2024 Santa Maria Project that were included in the EIR published by the City of Santa Maria.

The Richards Ranch Project has filed an application with the County of Santa Barbara for a Builder's Remedy Project ("County Builder's Remedy Project") and the Project statistics have been modified. Figure 1 (attached), shows the updated site plan for the County Builder's Remedy Project. The following analysis compares the trip generation estimates between the 2024 Santa Maria Project and the County Builder's Remedy Project. Additionally, the analysis provides a discussion of the Project site access driveways and street improvements. The analysis also contains an updated "Vehicle Miles Traveled" (VMT) analysis for the County Builder's Remedy Project using the County's adopted impact criteria.

PROJECT STATISTICS

The Project statistics from the EIR have since been modified. Table 1 provides a summary of the land uses assumed for each parcel for the 2024 Santa Maria Project and the currently proposed County Builder's Remedy Project.

Table 1
Assumed Land Use Statistics

| | | 2024 Santa Maria | County Builder's |
|-------------|--|----------------------|----------------------|
| Parcel | Land Use | Project | Remedy Project |
| Parcel 1 | Gas Station with Mart | 10 Fueling Positions | 12 Fueling Positions |
| (Northwest) | Lube Station | 3 Bays | - |
| (Northwest) | Car Wash-Automated | - | 1 Tunnel |
| | Shopping Center | 55,000 SF | - |
| | Sit-Down Restaurant | 5,000 SF | - |
| Parcel 2 | Fast-Food Restaurant w/ Drive-Thru (5) | 15,250 SF | - |
| (Northeast) | Fast Casual Restaurant | 6,000 SF | - |
| | Mini-Storage | 39,500 SF | 141,160 SF |
| | Residential | - | 72 Units |
| Parcel 3 | Fast-Food Restaurant w/ Drive-Thru | 3,500 SF | 3,419 SF |
| (Southwest) | Car Wash-Automated | 1 Tunnel | 1 Tunnel |
| Parcel 4 | Apartments/Townhomes | 495 Units | 522 Units |
| (Southeast) | Affordable Housing | - | 156 Units |

PROJECT TRIP GENERATION

Trip Generation Rates

Trip generation estimates were calculated for the current County Builder's Remedy Project using the rates contained in the ITE Trip Generation Manual, 11th Edition.¹ The rates for Multi-Family Housing Low-Rise (Land Use Code #220), Affordable Housing (Land Use Code #223), Fast Food Restaurant With Drive-Through Window (Land Use Code #934), Convenience Store/Gas Station (Land Use Code #945) and Mini-Warehouse (Land Use Code #151) were used for the analysis. Trip generation for the car wash was derived from local studies.

¹ Trip Generation, Institute of Transportation Engineers, 11th Edition, 2021.

Internal Capture Trip Estimates

Given the mix of land uses, there will be some trips that travel between the various parcels that comprise the site and not affect the off-site street network. "Internal Capture" trips include trip interactions between the commercial uses as well as between the commercial uses and residential uses. The analysis assumes 45% of the automated car wash customers would come from the service station or convenience market. The ITE mixed-use traffic model was used to estimate the number of trips that would be captured within the site (mixed-use model attached). Based on the results of the model, the 2024 Santa Maria Project assumed internal factors of 19% for ADT, 8% for the AM peak hour, and 30% for the PM peak hour. With the updated statistics, the County Builder's Remedy Project assumed internal factors of 19% for ADT, 13% for the AM peak hour, and 24% for the PM peak hour. It is noted that the internal factor for the PM peak hour was reduced for the County Builder's Remedy Project due to a reduction of commercial uses as part of the Project. Table 2 summarizes the trip generation comparison with the internal factors for the 2024 Santa Maria Project and the County Builder's Remedy Project (detailed worksheets attached).

Table 2
Project Trip Generation Comparison – With Internal Capture

| Component | ADT | AM Peak Trips | PM Peak Trips |
|---------------------------------|--------|---------------|---------------|
| County Builder's Remedy Project | 7,469 | 580 | 569 |
| 2024 Santa Maria Project | 16,768 | 1,332 | 1,221 |
| Net Totals | -9,299 | -752 | -652 |

The data in Table 2 show that the County Builder's Remedy Project is forecast to generate 9,299 less ADT, 752 less AM peak hour trips and 652 less PM peak hour trips than the 2024 Santa Maria Project (includes both primary and pass-by trips).

Commercial Pass-By/Primary Trip Estimates

Pursuant to ITE recommendations, the trip generation analysis also accounts for "Pass-By" trips and "Primary" trips that would be generated by the retail and restaurant uses. Pass-By trips are trips that would come from the existing traffic streams on Orcutt Expressway, the Union Valley Parkway (UVP), and Orcutt Road; and would not affect the study-area street network beyond the Project site. Primary trips are trips with the sole purpose of patronizing the commercial center (i.e., from home to the store and then return home). Based on the data presented in the ITE Trip Generation manual, the Pass-By trip percentages for the shopping center and restaurant uses range between 40% - 55%, the Pass-By trip percentage for the gas station is 75%, and the Pass-By trip percentage for the car wash is 20%. No AM pass-by rates are provided for shopping center and sit-down restaurant. To be conservative, the analysis assumed a 20% pass-by factor for the AM peak hour for these two land-uses. Table 3 summarizes the primary trip generation comparison with the pass-by factors for the 2024 Santa Maria Project and the County Builder's Remedy Project (detailed worksheets attached).

Table 3
Project Trip Generation Comparison – Primary Trips

| Component | ADT | AM Peak Trips | PM Peak Trips |
|---------------------------------|--------|---------------|---------------|
| County Builder's Remedy Project | 5,244 | 383 | 391 |
| 2024 Santa Maria Project | 10,189 | 787 | 693 |
| Net Totals (Primary Trips) | -4,945 | -404 | -302 |

The data in Table 3 show that the County Builder's Remedy Project is forecast to generate 4,945 less ADT, 404 less AM peak hour trips and 302 less PM peak hour trips than the 2024 Santa Maria Project based on the pass-by trip reductions.

SITE ACCESS AND CIRCULATION

The County Builder's Remedy Project proposes the same improvements, shown in Figure 2, that were developed for the 2024 Santa Maria Project, which would accommodate the smaller traffic volumes forecast for the County Builder's Remedy Project. It is noted that the site access and frontage improvements developed for the 2024 Santa Maria Project were reviewed multiple times by City and County staff.

As shown in Figure 2, access to each of the parcels would remain as shown in the 2024 Santa Maria Project. Additionally, the proposed frontage improvements along Orcutt Road and UVP would still be included. As noted previously, the County Builder's Remedy Project is forecast to generate less trips than the 2024 Santa Maria Project, therefore the driveway operations, driveway queuing and driveway sight distances previously analyzed are considered conservative and sufficient.

VMT ANALYSIS

The VMT analysis contained in the 2024 Santa Maria Project was conducted using the City of Santa Maria's adopted VMT impact criteria. The following VMT analysis for the County Builder's Remedy Project uses the County's adopted VMT impact criteria.

The County of Santa Barbara has adopted a new set of CEQA transportation impact standards, in compliance with Senate Bill 743, which are based on a Vehicle Miles Traveled (VMT) metric rather than the traditional Level of Service (LOS) metric.² Per the State's Natural Resource Agency Updated Guidelines for the Implementation of the CEQA adopted in 2018, VMT has been designated as the most appropriate measure of transportation impacts. "Vehicle Miles Traveled" refers to the amount and distance of automobile travel attributable to a project. Other relevant considerations may include the effects of the project on transit and non-motorized travel. For land use projects, vehicle miles traveled exceeding an applicable threshold of significance may indicate a significant impact.

Transportation Analysis Updates in Santa Barbara County, County of Santa Barbara, July 2020.

VMT Thresholds of Significance

The County's VMT thresholds of significance for land use projects are summarized in Table 4.

Table 4 Project VMT Thresholds of Significance

| Project Type Use | Threshold for Determination of Significant VMT Impact |
|----------------------|--|
| Residential | Project VMT exceeds a level of 15 percent below existing county VMT for |
| Residential | home-based VMT per resident. |
| Employment | Project VMT exceeds a level of 15 percent below existing county VMT for |
| Linployment | home-based work VMT per employee. |
| Regional Retail | Project VMT results in a net increase in total VMT. |
| | Evaluate each project component independently using the applicable thresholds |
| Mixed-Use Projects | of significance above for each component (e.g., for a mixed-use project with |
| wiixeu-Ose Frojects | residential and office uses, apply the residential and employment thresholds of |
| | significance for each component separately). |
| | For project types not listed above (e.g., school, sports or entertainment facility, |
| | park), the County will apply an absolute VMT threshold (e.g., total VMT or total |
| | roadway VMT) or efficiency-based VMT threshold (e.g., homebased VMT per |
| | resident, home-based work VMT per employee, or total VMT per service |
| | population). The applicable threshold will depend on the project's |
| Other Land Use Types | characteristics, including whether the project is locally or regionally serving. For |
| | projects that generally produce job-related travel (i.e., employment), the analysis |
| | can compare the project's VMT (i.e., home-based work VMT per employee) to |
| | existing county VMT. For projects that serve the region, the analysis can |
| | compare the project's total VMT to existing VMT, or compare the project's net |
| | increase in total VMT to the study area VMT |

VMT Thresholds and Screening Criteria

Table 5 provides a summary of the County's VMT screening criteria for land use projects based on the OPR Technical Advisory. The table contains a separate row and columns that list each project type and the applicable screening criteria. A project that meets at least one of these screening criteria would have a less-than-significant impact and therefore would not require further VMT analyses.

Table 5
Santa Barbara County VMT Screening Criteria

| SCREENING CATEGORIES | PROJECT REQUIREMENTS TO MEET SCREENING CRITERIA |
|--|---|
| Project Size | A project that generates 110 or fewer daily trips. |
| Local Serving Retail | A project that has locally serving retail uses that are 50,000 square feet or less, such as specialty retail, shopping center, grocery/food store, bank/financial facilities, fitness center, restaurant, or cafe. If a project also contains a nonlocally serving retail use(s), that use(s) must meet other applicable screening criteria |
| Project Located in a VMT Efficient Area | A residential or employment project that is located in an area that is already 15 percent below the county VMT (i.e., "VMT efficient area"). The County's Project Level VMT Calculator determines whether a proposed residential or employment project is located within a VMT efficient area. |
| Transit Proximity | A project that is located within a ½ mile of a major transit stop or within a ½ mile of a bus stop on a high-quality transit corridor (HQTC). A major transit stop is a rail station or a bus stop with two or more intersecting bus routes with service frequency of 15 minutes or less during peak commute periods. A HQTC is a corridor with fixed route bus service with frequency of 15 minutes or less during peak commute periods. However, these screening criteria do not apply if project-specific or location-specific information indicates the project will still generate significant levels of VMT. Therefore, in addition to the screening criteria listed above, the project should also have the following characteristics: • Floor area ratio (FAR) of 0.75 or greater; • Consistent with the applicable SBCAG Sustainable Communities Strategy (as determined by the County); • Does not provide more parking than required by the County's Comprehensive Plan and zoning ordinances; and • Does not replace affordable housing units (units set aside for very low income and low income households) with a smaller number of moderate or high-income housing units. |
| Affordable Housing | A residential project that provides 100 percent affordable housing units (units set aside for very low income and low income households); if part of a larger development, only those units that meet the definition of affordable housing satisfy the screening criteria. |

Criteria For Mixed-Use Developments

The County's CEQA Thresholds provides the following guidance for mixed-use projects:

"Mixed-Use Projects - Evaluate each project component independently using the applicable thresholds of significance above for each component (e.g., for a mixed-use project with residential and office uses, apply the residential and employment thresholds of significance for each component separately)."

Based on this requirement, the potential VMT impacts of each Project component were analyzed separately, as reviewed in the following sections.

Restaurant/Retail VMT Impact Analysis

Restaurant/Retail VMT Thresholds and Screening Criteria

The County's VMT screening threshold for the restaurant/retail component of the Project is listed below.

"Locally Serving Retail - A project that has locally serving retail uses that are 50,000 square feet or less, such as *specialty retail*, shopping center, grocery/food store, bank/financial facilities, fitness center, restaurant, or cafe. If a project also contains a non-locally serving retail use(s), that use(s) must meet other applicable screening criteria."

Restaurant/Retail VMT Analysis

Given the size of the restaurant/retail component of the Project, it would be considered "local-serving" based on the County's thresholds (50,000 SF or less). The restaurant/retail component of the mixed-use project would therefore have a less than significant impact based on County thresholds.

Mini-Storage VMT Impact Analysis

Mini-Storage VMT Thresholds and Screening Criteria

The County's VMT screening threshold for the mini-storage component of the Project is listed below.

"Project Size – A Project that generates 110 or fewer daily trips"

Mini-Storage VMT Analysis

The mini-storage component of the Project is forecast to generate 166 ADT, thus a VMT analysis is required.

VMT Thresholds

Pursuant to guidance set forth in CEQA Guidelines Section 15064.3, for retail development projects, redevelopment projects, medical development projects, and infrastructure projects that require a VMT analysis the City has adopted "net change" in VMT as the applicable threshold for determining a significant impact (i.e., if the with-project VMT) is greater than the without-project VMT).

VMT Analysis

The mini-storage component of the Project would provide convenient storage opportunities for the Project's proposed multifamily units as well as the surrounding residential neighborhoods which are currently underserved for mini-storage services.

The nearest storage facility is located approximately 2.1 miles northwest of the site. Given the lack of mini-storage facilities in the Project study area and along the whole stretch of Union Valley Parkway, it is anticipated that the proposed mini-storage will result in a significant reduction in VMT within the County and the Orcutt Area.

Residential VMT Impact Analysis

Residential VMT Thresholds and Screening Criteria

The County's VMT screening threshold for residential component of the Project is as follows:

"Residential - Project VMT exceeds a level of 15 percent below existing county VMT for home-based VMT per resident."

Residential VMT Analysis

As part of the SB 743 implementation process, the County developed a "Project-Level VMT Calculator" to evaluate land use projects. The calculator includes a database of VMT information using data from the SBCAG regional model. The VMT data are reported as (1) total VMT, (2) total VMT per service population, (3) home-based VMT per resident, and (4) home-based-work VMT per employee.

The County's VMT Calculator was used to develop the VMT estimates for the residential component of the Project (VMT calculator results attached). As noted previously, the ITE mixed-use traffic model shows that up to 19% (average of AM and PM peak hours) of the trips generated by the residential component of the Project would be internal to the site. This 19% mixed-use factor was also applied to the County's VMT estimates to determine if the Project would exceed the County's VMT impact thresholds. Table 5 presents the results of the analysis (VMT calculation worksheet attached).

Table 5
VMT Analysis – Residential Component

| | | Project VMT Estimate | | Potential |
|------------------|------------|--------------------------------|-----------------------|-----------|
| Parcel | # of Units | (With 19% Mixed-Use Reduction) | County Threshold | Impact? |
| Northeast Parcel | 72 Units | 13.9 VMT Per Resident | 14.9 VMT Per Resident | NO |
| Southeast Parcel | 678 Units | 14.9 VMT Per Resident | 14.9 VMT Per Resident | NO |
| Average | | 14.4 VMT Per Resident | 14.9 VMT Per Resident | NO |

The data presented in Table 5 indicate that the residential portion of the Project would generate an average of 14.4 VMT per resident with the mixed-use adjustments, which would not exceed the County's threshold of 14.9 VMT per resident (as shown on the VMT Calculator worksheet). The residential portion of the Project would therefore have a less than significant impact based on County Thresholds.

This concludes ATE's trip generation comparison, site access and VMT analysis for the Richards Ranch Project.

| Cinema/Entertainment | N/A | N/A | | |
| Residential | 57% | 34% | | |
| Hotel | N/A | N/A | | |

Total estimate for all other land uses at mixed-use development site is not subject to internal trip capture computations in this estimator.

³Enter trips assuming no transit or non-motorized trips (as assumed in ITE *Trip Generation Manual*).

⁴Enter vehicle occupancy assumed in Table 1-P vehicle trips. If vehicle occupancy changes for proposed mixed-use project, manual adjustments must be made ⁵Vehicle-trips computed using the mode split and vehicle occupancy values provided in Table 2-P.

⁶Person-Trips

*Indicates computation that has been rounded to the nearest whole number.

COUNTY OF SANTA BARBARA VMT TOOL

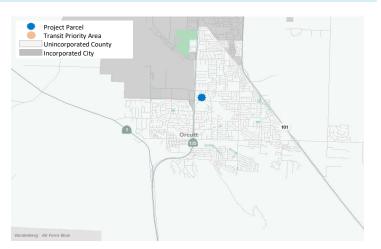

Project Information Project Name **NOP Year** Richards Ranch - Northeast Parcel 2025 Parcel Numbers (County Land Use and Zoning Map) 107250021 **Project Land Use Information** Residential Values Unit Single-Family Housing 0 DU 72 Multi-Family Housing DU 0 Affordable Housing DU **Employment** Values Unit 0.000 General Office KSF 0.000 Medical Office KSF 0.000 KSF Retail / Service 0.000 Light Industrial KSF 0.000 Manufacturing KSF **Custom Land Use** Values Unit Custom Land Use (ignores all other land use entries) Daily Trips

Project Daily Trips = 327

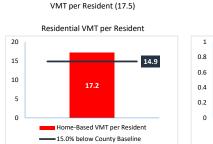

Screening Criteria

| Does the project generate 110 or fewer average daily trips? (enter project land use in the section above) | No |
|--|-----|
| Is the project screened in a Transit Priority Area? | No |
| Does the project have locally serving retail uses that are 50,000 square feet or less? | N/A |
| Is the project located in a VMT efficient area for Residential uses? | No |
| Is the project located in a VMT efficient area for Employment uses? | N/A |
| Is the residential portion of the project 100% affordable housing (units set aside for very low income and low income households)? | No |

Project Location

Project VMT Estimate

County Baseline Home-Based

County Baseline Home-Based Work VMT per Employee (N/A)

Project VMT with 19% Mixed-Use Reduction: = 13.9 VMT per Resident

Project cannot be screened from analyzing potential impacts to VMT (threshold b), and a VMT transportation study may be required.

COUNTY OF SANTA BARBARA VMT TOOL
