COUNTY OF SANTA BARBARA
PLANNING AND DEVELOPMENT

MEMORANDUM

TO: County Planning Commission

FROM: Travis Seawards, Deputy Director, Development Review Division

STAFF CONTACT: Alia Vosburg, Planner, (805) 934-6259

DATE: August 5, 2022

HEARING DATE: August 10, 2022

RE: Appellant No. 1 Supplemental Submittal – Appeals of the Nojoqui Farms Cannabis Cultivation Project, Case Nos. 21APL-00000-00043, 21APL-00000-00044, and 19LUP-00000-00530

Summary:
On August 23, 2021, Appellant No. 1, Edward Seaman, filed a timely appeal of the Director's approval of the Nojoqui Farms Cannabis Cultivation Project, Case No. 19LUP-00000-00530. The Staff Report dated August 2, 2022, provides staff's response to the Appellant No. 1's August 23, 2021, appeal package.

On August 1, 2022, Appellant No. 1 submitted a Supplemental Appeal Package included as Attachments A-1, A-2, A-3, and A-4 to this Staff Memorandum. In the Supplemental Appeal Package two primary appeal issues are raised. These appeal issues and staff's responses are discussed below.

Supplemental Appeal Issue No. 1:
The Supplemental Appeal Package includes a hydrogeological Technical Memorandum (Attachment A-2) that disputes the Applicant's Water Source and Water Demand Memo. The Appellant's Technical Memo asserts that the water pumped from the Project wells is subterranean stream flow of Nojoqui Creek and Moonshine Creek, respectively, and as such, the Project and associated pumping must comply with the State Water Resources Control Board (SWRCB) Cannabis Cultivation Policy including the Numeric and Narrative Instream Flow Requirements established in the Policy.

Staff Response:

As discussed in the Staff Report dated August 2, 2022, the Applicant provided a Water Source and Water Demand Memo, prepared by a Professional Geologist, that includes details on the source of water drawn from Project wells, historic water use of the subject property, and projected water demand of the proposed Project. As discussed in the Water Source and Water Demand Memo, the projected water use of the Project will be below the historic water use on the Project site, and the Project wells are isolated from subterranean stream flow. The Appellant's Technical Memorandum does not dispute the conclusions of the Water Source and Water Demand Memo with respect to historic water use of the subject property and projected water demand of the proposed Project. The Appellant's Technical Memorandum only disputes the conclusion of the Water Source and Water Demand Memo that the Project wells are isolated from subterranean stream flow. The Appellant's Technical Memorandum asserts that the water pumped from the Project wells is subterranean stream flow of Nojoqui Creek and Moonshine Creek, respectively, and as such, the Project and associated pumping must comply with the SWRCB Cannabis Cultivation Policy including the Numeric and Narrative Instream Flow Requirements established in the Policy (e.g., pumping restrictions).

Ultimately, the permitting of surface water diversions, as well as diversions of groundwater that constitute a subterranean stream flowing in a known and definite channel, is within the exclusive jurisdiction of the SWRCB. In the event that the SWRCB determines that the Project's water source constitutes a subterranean stream flowing in a known and definite channel, the Project will be required to comply with all applicable regulations. Pursuant to Condition 21 of the Conditions of Approval (Attachment B to the Staff Report dated August 2, 2022), the Project must be operated to the satisfaction of the SWRCB, and in compliance with the SWRCB's Cannabis Cultivation Policy, which includes policies that 1) apply to surface and subsurface stream diversions, 2) that limit such diversions, and 3) that may restrict percolating groundwater diversions "where such restrictions are necessary to protect instream flows". However, P&D staff met with SWRCB staff to discuss the general issue of subterranean water flows in the County. During that meeting, SWRCB Water Rights Division staff confirmed that unless there is an existing determination by the State Water Board identifying a specific well as a surface water diverter, there is a presumption that all subsurface water is percolating groundwater. This information is confirmed in the email from SWRCB staff, dated April 7, 2022, and included as Attachment B to this Staff Memo. The SWRCB has not determined that the Project wells constitute subsurface stream diversions and has confirmed that absent such a determination, the wells are presumed to be sources of groundwater. Additionally, the Water Source and Water Demand Memo concluded that the Project is unlikely to substantially affect instream flows.

According to the Applicant's Water Source and Water Demand Memo, projected water usage for the proposed Project will be 26.6 acre-feet per year (AFY), and represents a 51% reduction in water use of the Project Site when compared to the 51.5 AFY average used over the previous 10 years of non-cannabis agricultural production onsite. Accordingly, there is substantial evidence that the Project's use of groundwater from the Project Site's existing wells provides an adequate water supply for the proposed Project.

Supplemental Appeal Issue No. 2

In the Supplemental Appeal Package Cover Letter (Attachment A-1) Appellant No. 1 states: *"In the petition and for the record, I formally object to the Nojoqui Farms Cannabis Project for the following reasons: deleterious water usage in an already impaired watershed, using fragile dryland regions to grow non-food crops and not food (food security), odor, vehicle traffic, crime, long-term business viability, lowered property values and broad ecosystem destruction."*

Staff Response:

The appeal issues pertaining to water use and odor are addressed above and in the Staff Report dated August 2, 2022. As previously discussed, the Applicant's Water Source and Water Demand Memo demonstrates that the Project will result in a reduction of the historic water use of the subject property. The conclusions of the Water Source and Water Demand Memo with respect to historic water use of the subject property and projected water demand of the proposed Project have not been disputed. Accordingly, there is substantial evidence that the Project's use of groundwater from the Project Site's existing wells provides an adequate water supply for the proposed Project. Further, the conclusions of the Water Source and Water Demand Memo demonstrate a beneficial impact of the proposed Project with respect to groundwater resources, when compared to the historic baseline use, against which the Project is evaluated under CEQA. Accordingly, there is substantial evidence that the Project was appropriately reviewed under CEQA with respect to groundwater resources.

The Appellant did not provide any additional information or supporting evidence pertaining to the other broad appeal issues that were cited (e.g., vehicle traffic, crime, broad ecosystem destruction, etc.). Additionally, the Appellant did not provide any information to demonstrate how these broad appeal issues constitute a failure of the Project to comply with an applicable development standard or Comprehensive Plan policy, or a failure to comply with CEQA. As demonstrated in Sections 6.2, 6.3, and 6.4 of the Staff Report dated August 2, 2022, the Project was appropriately reviewed under CEQA and is consistent with the Santa Barbara County Comprehensive Plan and applicable policies and standards set forth in the Land Use and Development Code.

Recommended Action:

As such, Staff recommends the Planning Commission take the action provided in the Staff Report dated August 2, 2022, repeated as follows:

1. Deny the appeals, Case Nos. 21APL-00000-00043 and 21APL-00000-00044.

2. Make the required findings for approval of the Project as specified in Attachment A of this Staff Report, including California Environmental Quality Act (CEQA) findings.

3. Determine that the previously certified Programmatic Environmental Impact Report (PEIR) (17EIR-00000-00003) is adequate and no subsequent environmental review is required pursuant to CEQA Guidelines §15162 and 15168(c) (Staff Report Attachments C and D).

4. Grant *de novo* approval of the Project, Case No. 19LUP-00000-00530, subject to the conditions included in Attachment B of this Staff Report.

APPEAL OF NOJOQUI FARMS CANNABIS CULTIVATION PROJECT

EXECUTIVE INTRODUCTION

08/01/22

County Planning Commission
123 East Anupama Street
Santa Barbara, CA 93101
19LUP-00000-00530, Nojoqui Farms Cannabis Cultivation Project Appeal

Mr. Villalobos,

Please accept the files in this shared folder for submission to the commission as a part of my Nojoqui Farms Cannabis Appeal. In addition to the technical documentation and exhibits prepared by our subject matter expert (19LUP-00000-00530-WaterClassification.pdf, Exhibit 1.pdf, Exhibit 2.pdf), you will find a confirmation from the Cachuma Water District that there have been no formal water studies done in the Nojoqui Creek area and a copy of our petition log that contains names and comments from members of the general public. Start with reading the Water Classification pdf.

Please note that, although I appealed the Nojoqui Farms project primarily due to water concerns, the petition signers are members of the public that have additional, very legitimate concerns that I gave a platform to. Please review the petition document and pay special attention to the thoughtful comments you will find scattered throughout the 250+ signatories on the list. If we need to escalate beyond the planning commission, these comments should be of great interest to the board of supervisors.

In the petition and for the record, I formally object to the Nojoqui Farms Cannabis project for the following reasons: deleterious water usage in an already impaired watershed, using fragile dryland regions to grow non-food crops and not food (food security), odor, vehicle traffic, crime, long-term business viability, lowered property values and broad ecosystem destruction. Our neighbors in the Nojoqui Falls Corridor agree with me in this.

While our singular focus in the hearing will be water, it is important to me that these other concerns are entered into the record.

Respectfully,

Ed Seaman

TECHNICAL MEMORANDUM

TO: Planning Commission, County of Santa Barbara

FROM: Brad Newton, Ph.D., P.G. #8181

RE: 19LUP-00000-00530: Project Water Classification – Regulatory

DATE: May 16, 2022

EXECUTIVE SUMMARY

This memorandum documents the hydrogeologic basis for the characterization of the water pumped from the Nojoqui Main Well (40500) and two secondary wells (Moonshine #1 and Moonshine #2), for the proposed cannabis cultivation project as described in Land Use Permit No. 19LUP-00000-00530, County of Santa Barbara, Ca, located at 1889 Us-101 Highway, Buellton, Ca, 93427 ("subject property"), as **subterranean stream flow of the Nojoqui Creek and Moonshine Creek, respectively,** in a known and definite channel.

The subterranean channel has relatively impermeable bed and banks, a course that is known by evaluation of the geologic setting and Water Well Drillers Reports, and has groundwater flowing in it. **Therefore, the proposed project must comply with the State Water Resources Control Board (SWRCB) Cannabis Cultivation Policy, and the proposed pumping must adhere to the Numeric and Narrative Instream Flow Requirements established in this Policy (Cannabis Cultivation Policy: Attachment A, Section 3, dated February 5, 2019).**

BACKGROUND

The purpose of this Cannabis Cultivation Policy (Policy) is to ensure that the diversion of water and discharge of waste associated with cannabis cultivation does not have a negative impact on water quality, aquatic habitat, riparian habitat, wetlands, and springs. This Policy applies to the following cannabis cultivation activities throughout California. **All water diversions for cannabis cultivation from a surface stream, subterranean stream flowing through a known and definite channel (e.g., groundwater well diversions from subsurface stream flows), or other surface waterbody are subject to the surface water Numeric and Narrative Instream Flow Requirements.** This includes lakes, ponds, and springs (unless the spring is deemed exempt by the Deputy Director).

Cannabis cultivation legislation enacted California Water Code (Water Code) section 13149, which directs the State Water Board, in consultation with the California Department of Fish and

Wildlife (CDFW), to adopt interim and long-term principles and guidelines for the diversion and use of water for cannabis cultivation in areas where cannabis cultivation may have the potential to substantially affect instream flows. The legislation requires the State Water Board to establish these principles and guidelines as part of a state policy for water quality control. Per Water Code section 13149, the principles and guidelines:

- shall include measures to protect springs, wetlands, and aquatic habitats from negative impacts of cannabis cultivation; and

- may include requirements that apply to groundwater diversions where the State Water Board determines those requirements are reasonably necessary.

Additionally, Business and Professions Code section 26060.1(b) requires that these principles and guidelines be included as conditions in cannabis cultivation licenses issued by the California Department of Food and Agriculture (CDFA). The State Water Board has primary enforcement responsibility for the principles and guidelines and shall notify CDFA of any enforcement action taken.

The following has been Ordered by the SWRCB as outlined in the Numeric and Narrative Instream Flow Requirements:

A Cannabis cultivators shall not divert from a surface water (including subterranean stream flow) for cannabis cultivation between April 1 and October 31; and that between November 1 and March 31, cannabis cultivators shall not divert from a surface water or from a subterranean stream for cannabis cultivation at a rate more than a maximum instantaneous diversion rate of 10 gallons per minute, unless authorized under an existing appropriative water right.

SWRCB Regulatory Classification of Subterranean Stream

The SWRCB permitting jurisdiction over groundwater is generally limited to groundwater that meets criteria adopted by SWRCB in Water Board Decision 1639 regarding Garrapata Creek in Monterey County. The Garrapata Decision provides a test for SWRCB jurisdiction for water right permitting of groundwater extractions.

The following physical conditions must exist for groundwater to be classified as a subterranean stream flowing through a known and definite channel:

1. A subsurface channel must be present;
2. The channel must have relatively impermeable bed and banks;
3. The course of the channel must be known or capable of being determined by reasonable inference; and
4. Groundwater must be flowing in the channel.

Notably, proximity of a well to the stream, or the physical attributes of a well, are not part of the so called four-part test.

PROPOSED PROJECT REGIONAL HYDROGEOLOGY DESCRIPTION

Water Source & Water Demand (revised), prepared by Charles E. Katherman (CA PG #4069) and dated March 2020 (Exhibit 1), states the following:

The subject property is within a small intermontane basin where **ground water is associated with an erosional depression of limited extent containing various thicknesses (10 – 200 feet) of young, Quaternary alluvial sediments associated with the area's streams, creeks, and drainages**. The Nojoqui Farm is bordered on the west by the Nojoqui Creek and the east by US Highway 101. The Primary ridgeline of the Santa Ynez Mountain Range lies between the subject property and the Pacific Ocean, which directs runoff from the significant drainage to the north toward the Santa Ynez River. The estimated watershed for the Nojoqui Creek is approximately 20 square miles, a fairly large drainage area for a small basin. **Consequently, recharge to the area alluvial aquifers is mostly from winter rainfall/runoff and creek water infiltration, as well as some contribution from area irrigation seepage** (Exhibit 1: last paragraph of page 2 through first paragraph of page 3).

Geologically, the Nojoqui Farm parcels are located in an east-west trending fold belt that makes up the northern flank of the Santa Ynez Mountains. **The area is underlain primarily with consolidated older sediments of the Cretaceous and Mid-Tertiary aged rocks (Figure 5). These Mid-Tertiary rocks, including the Matillja, Cozy Dell, Gaviota and Sacate Formations, typically do not contain large volumes of groundwater, lacking enough porosity and permeability to hold significant water** (Figure 6A&6B**). However, where these units do contain water is usually associated with overlying groundwater, such as that found in alluvial sediments in rivers, streams and drainages** (Exhibit 1: first paragraph of Geohydrology section page 2).

Consequently, the primary ground water sources here are the shallow alluvial sediments that overlie the older rocks. Varying in thickness from 10 feet to 200 feet, these alluvial sediments have formed over time due to erosion of the surrounding older rocks and the deposition of eroded clays, silts, sands and gravels into the low-lying areas within the drainages of the local creeks and streams (Exhibit 1: first paragraph of Geohydrology section page 2).

PROPOSED PROJECT WELLS DESCRIPTION

The Nojoqui Farm Main Well was drilled in 1964 to **a depth of 76 feet**. The well was completed with 8-inch steel casing to a depth of 55 feet. The production perforations were steel (Mills) knife cut from 44 ' to 49', which corresponds to a permeable water zone at the same depth. The standing level or static level following the completion of this well was measured at 30 feet (Well Completion Report in Appendix). However, it is likely that the older sediments from 50 feet to 76 feet are also contributing groundwater to the Main Well's productive capacity, as there is no restriction to potential flow from the bottom of the casing at 55 feet and from the sediments in the open borehole below the casing. **A cement sanitary seal was placed in this well from 22 feet to the surface** (Exhibit 1: first paragraph of Main Well section page 4).

Moonshine 1 was drilled in November of 1995 to **a total depth of 180 feet**. The well was completed with 6 inch steel casing run to 180 feet. The perforated or screened interval was 60 feet to 180 feet. **A cement sanitary seal was placed from 60 feet to the surface** (Exhibit 1: second paragraph of Secondary Wells section page 5).

The Moonshine #2 Well was drilled in October of 2016 to **a total depth of 800 feet**. The well was completed with 6-inch PVC casing that was landed at 800 feet. The well's screened interval was from 260 to 800 feet with **a 51 foot cement sanitary seal** (Exhibit 1: second paragraph of Secondary Wells section page 5 to first line of page 6).

All 3 wells produce water from the bottom of the sanitary seal to the total drilled depth. The Main Well pumps from 22 feet below ground surface (ft bgs) to 76 ft bgs. Moonshine #1 pumps water from 60 ft bgs to 180 ft bgs. And, Moonshine #2 pumps water from 51 ft bgs to 800 ft bgs.

CLASSIFICATION OF WATER PRODUCED BY WELLS AS DESCRIBED IN THE PROPOSED PROJECT

The SWRCB Garrapata Decision provides a test for groundwater to be classified as a subterranean stream flowing through a known and definite channel. Water Source & Water Demand (revised) report, prepared by Charles E. Katherman (CA PG #4069) and dated March 2020 (Exhibit 1), purports evidence (1 – 6) that the water produced by the project wells is "percolating groundwater". **This is not consistent with the SWRCB definition.**

The following section titled "Origin of Produced Well Water" of the Water Source & Water Demand (revised) report, prepared by Charles E. Katherman (CA PG #4069) and dated March 2020 (Exhibit 1), states the following:

> **ORIGIN OF PRODUCED WELL WATER**
>
> One of the primary questions being addressed here is whether the water supplied to the Nojoqui Farm operations is surface water or groundwater. The answer is percolating groundwater. The evidence supporting a determination of a groundwater is as follows:
>
> 1. The recent pump test on the Main Well showed no influence on the nearby Nojoqui Creek. The creek level and the static levels of two nearby wells were monitored throughout the test period and no significant changes were observed.
> 2. Following the termination of the Main Well pump test, a 30 minute recovery period was observed with the water level returning to the static level measured at the beginning of the pump test. A failure of the recovered water level to return to the depth of the beginning static level would have indicated a major loss of water from the aquifer and a subsequent drop in the creek level. None was observed.
> 3. When the Main Well was drilled and completed the static level was 30 feet below grade, which is well below (26 feet) the elevation ofthe surface water in Nojoqui Creek, indicating a lack of a direct connection in the subsurface with the creek surface waters.
> 4. The subject Nojoqui Main Well contains a confining clay layer from near surface to 37 feet. This clay layer is mostly impermeable and will not readily transmit water downward into the water-bearing sediments below it. This clay zone likely also confines the subsurface flow from communicating directly with the surface flow (Figure 10).

5. In support of Statement #4 above, there are different water chemistries between the surface water ofthe creek and the water-bearing sediments below the confining clay layer. The chemical analysis on the creek surface water is pending, but a handheld Total Dissolved Solids (TDS) meter indicated a TDS or salinity level of 300 parts per million (ppm) versus 860 ppm for the recently tested groundwater being produced from the Main Well. A significantly different value for salinity further indicates that the subsurface water produced by the Main Well is not communicating at this location with the surface waters from the Nojoqui Creek.

6. One of the key tests for determining whether the Nojoqui Well is producing surface water versus groundwater is the four-part Garrapata test (SWRCB), which states that for water flow to be classified as a subterranean stream flowing through a known and definite channel, the following physical conditions must exist: (a) a subsurface channel must be present; (b) the channel must have a relatively impermeable bed and banks; (c) the course of the channel must be known or capable of being determined by reasonable inference; and (d) water must be flowing in the channel.

   In the case of the Nojoqui Well the hydrogeological conditions that exist do not meet the Garrapata criteria of Parts b and d. The channel of Nojoqui Creek is underlain by permeable sediments of the Tertiary Sacate/Gaviota Formation, which is water-bearing and productive in area water wells to the north of the subject Nojoqui Main Well; and likely contributes groundwater to the overall flow from the Main Well. As for Part d, the subsurface water within the alluvial sediments penetrated by the Nojoqui Well does not continue flowing north in conjunction with the Nojoqui Creek surface water, which flows north 3.5 miles to the Santa Ynez River. The subsurface water in the alluvial sediments below the confining layer is ponded behind the area's older sediments which outcrop at the surface north of the Nojoqui Main Well. This bathtub effect is shown in the north-south cross section in Figure 10.

PROPOSED PROJECT CLASSIFICATION OF WATER IS NOT CONSISTENT WITH THE SWRCB REGULATORY DEFINITION.

The SWRCB Cannabis Cultivation Policy defines policy applicability for:

"All water diversions for cannabis cultivation from a surface stream, subterranean stream flowing through a known and definite channel (e.g., groundwater well

diversions from subsurface stream flows), or other surface waterbody are subject to the surface water Numeric and Narrative Instream Flow Requirements."

The SWRCB Garrapata Decision provides a test for groundwater to be classified as a subterranean stream flowing through a known and definite channel. **The 6 items of purported evidence** from the "Origin of the Produced Well Water" section of the Water Source & Water Demand (revised) report, prepared by Charles E. Katherman (CA PG #4069) and dated March 2020 (Exhibit 1), **are not part of the so called four-part test**.

1. Pump test influence on nearby creeks **is not part of the SWRCB test**.
2. Recovery period following a pump test **is not part of the SWRCB test**.
3. Static water level relative to the surface water within a creek **is not part of the SWRCB test**.
4. A confining clay layer or specific stratigraphy **is not part of the SWRCB test**.
5. Water chemistry **is not part of the SWRCB test**.
6. Two parts (b and d) are purported to be evidence that the water produced by the wells is not subject to SWRCB authority:

> Part b: The channel of Nojoqui Creek is underlain by permeable sediments of the Tertiary Sacate/Gaviota Formation, which is water-bearing and productive in area water wells to the north of the subject Nojoqui Main Well; and likely contributes groundwater to the overall flow from the Main Well (Exhibit 1, page 7).
>
> However, this statement is contradicted by:

The area is underlain primarily with consolidated older sediments of the Cretaceous and Mid-Tertiary aged rocks (Figure 5). These Mid-Tertiary rocks, including the Matillja, Cozy Dell, Gaviota and Sacate Formations, typically do not contain large volumes of groundwater, lacking enough porosity and permeability to hold significant water (Figure 6A&6B**). However, where these units do contain water is usually associated with overlying groundwater, such as that found in alluvial sediments in rivers, streams and drainages** (Exhibit 1: first paragraph of Geohydrology section page 2). Moreover, **all 3 wells produce water from the bottom of the sanitary seal to the total drilled depth. The Main Well pumps from 22 feet below ground surface (ft bgs) to 76 ft bgs. Moonshine #1 pumps water from 60 ft bgs to 180 ft bgs. And, Moonshine #2 pumps water from 51 ft bgs to 800 ft bgs. In all**

three wells, the water producing portion of the stratigraphy includes the Quaternary Alluvium sediments, which are within the definable bed and banks of the subterranean stream channel.

> Part d: the subsurface water within the alluvial sediments penetrated by the Nojoqui Well does not continue flowing north in conjunction with the Nojoqui Creek surface water, which flows north 3.5 miles to the Santa Ynez River. The subsurface water in the alluvial sediments below the confining layer is ponded behind the area's older sediments which outcrop at the surface north of the Nojoqui Main Well. This bathtub effect is shown in the north-south cross section in Figure 10 (Exhibit 1, page 7).
>
> However, **to where** the water flows **is not part of the SWRCB test.**

CLASSIFICATION OF PROPOSED PROJECT WATER PRODUCED BY WELLS CONSISTENT WITH THE SWRCB REGULATORY DEFINITION

The Water Board Garrapata Decision four-part test for SWRCB jurisdiction for water right permitting of groundwater extractions is founded upon the following physical conditions for groundwater to be classified as a subterranean stream flowing through a known and definite channel:

1. A subsurface channel must be present;
2. The channel must have relatively impermeable bed and banks;
3. The course of the channel must be known or capable of being determined by reasonable inference; and
4. Groundwater must be flowing in the channel.

Part 1: Description of the subterranean channel

The subject property is within a small intermontane basin where **ground water is associated with an erosional depression of limited extent containing various thicknesses (10 – 200 feet) of young, Quaternary alluvial sediments associated with the area's streams, creeks, and drainages. … recharge to the area alluvial aquifers is mostly from winter rainfall/runoff**

and creek water infiltration, as well as some contribution from area irrigation seepage (Exhibit 1: last paragraph of page 2 through first paragraph of page 3)

Geological Survey Water Supply Paper 1107 (USGS, 1951) describes the geology of the shallow and water bearing sediments of the Santa Ynez River Basin, which includes the Nojoqui Creek tributary. **The deposits that constitute the younger alluvium are known chiefly from well logs and consist of unconsolidated clay, silt, sand, and gravel. They range in thickness from a feather edge to a maximum of about 200 feet, and they rest unconformably on all the older formations heretofore described. The younger alluvium was deposited in valleys carved by former streams that flowed toward a shoreline at least 200 feet below present sea level.**

USGS and DWR driller well log database contains thirteen additional well logs, dated from the 1960s to present, within or proximal to the subject property. All of these well completion reports show well designs that allow subterranean stream flow water to be produced from each of the wells. This evidence demonstrates the long history of wells producing from the subterranean channel (Exhibit 2).

The proposed project acknowledges the presence of subsurface channel in the report titled "Water Source & Water Demand (revised)", prepared by Charles E. Katherman (CA PG #4069) and dated March 2020 (Exhibit 1), stating the following:

Consequently, the primary ground water sources here are the shallow alluvial sediments that overlie the older rocks. Varying in thickness from 10 feet to 200 feet, these alluvial sediments have formed over time due to erosion of the surrounding older rocks and the deposition of eroded clays, silts, sands and gravels into the low-lying areas within the drainages of the local creeks and streams (Exhibit 1: first paragraph of Geohydrology section page 2).

The subsurface channel contains these Quaternary Alluvial deposits of silt, sand, and gravels from which the wells produce water, below the sanitary seal (**The Main Well pumps from 22 feet below ground surface (ft bgs) to 76 ft bgs. Moonshine #1 pumps water from 60 ft bgs to 180 ft bgs. And, Moonshine #2 pumps water from 51 ft bgs to 800 ft bgs**).

Part 2: Relatively impermeable bed and banks of the subterranean channel

Geological Survey Water Supply Paper 1107 (USGS, 1951) describes the geology of the consolidated bedrock underlying the Nojoqui Creek tributary. **The consolidated rocks of**

Tertiary age are not water bearing at most places, but contain some water in fractures. Such as is obtainable is small in amount and uncertain in location. No wells derive water exclusively from them; and a few wells obtain water of a chemical quality unsuitable for some agricultural uses. Essentially, these rocks constitute relatively impermeable sides and bottoms for overlying bodies of water-bearing deposits.

The proposed project acknowledges the relatively impermeable characteristic of the underlying consolidated rocks in the report titled "Water Source & Water Demand (revised)", prepared by Charles E. Katherman (CA PG #4069) and dated March 2020 (Exhibit 1), stating the following:

Geologically, the Nojoqui Farm parcels are located in an east-west trending fold belt that makes up the northern flank of the Santa Ynez Mountains. **The area is underlain primarily with consolidated older sediments of the Cretaceous and Mid-Tertiary aged rocks (Figure 5). These Mid-Tertiary rocks, including the Matillja, Cozy Dell, Gaviota and Sacate Formations, typically do not contain large volumes of groundwater, lacking enough porosity and permeability to hold significant water** (Figure 6A&6B**). However, where these units do contain water is usually associated with overlying groundwater, such as that found in alluvial sediments in rivers, streams and drainages** (Exhibit 1: first paragraph of Geohydrology section page 2).

Five additional wells (6N/32W-36 R1, R2, R3, R4, and R5), located on the subject property, are all completed within 70 feet depth from the ground surface and within the alluvium deposits of the Nojoqui Creek that lie on top of the impermeable bed and banks (Exhibit 2).

The subject property is within a small intermontane basin where **ground water is associated with an erosional depression of limited extent containing various thicknesses (10 – 200 feet) of young, Quaternary alluvial sediments associated with the area's streams, creeks, and drainages**. The Nojoqui Farm is bordered on the west by the Nojoqui Creek and the east by US Highway 101. The Primary ridgeline of the Santa Ynez Mountain Range lies between the subject property and the Pacific Ocean, which directs runoff from the significant drainage to the north toward the Santa Ynez River. The estimated watershed for the Nojoqui Creek is approximately 20 square miles, a fairly large drainage area for a small basin. **Consequently, recharge to the area alluvial aquifers is mostly from winter rainfall/runoff and creek water infiltration, as well as some contribution from area irrigation seepage** (Exhibit 1: last paragraph of page 2 through first paragraph of page 3).

Part 3: Course of the subterranean channel must be known or capable of being determined

The proposed project acknowledges the course of the subterranean channel as Quaternary Alluvium (Qa) identified on the geologic map (Figure 6A in the report titled "Water Source & Water Demand (revised)", prepared by Charles E. Katherman (CA PG #4069) and dated March 2020 (Exhibit 1).

The thirteen well logs from the USGS and DWR driller well log database as shown on the topographic map describe the course of the subterranean channel in the area of the subject property (Exhibit 2).

Part 4: Groundwater must be flowing in the channel

The proposed project acknowledges the presence of groundwater within the subsurface channel in the report Water Source & Water Demand (revised), prepared by Charles E. Katherman (CA PG #4069) and dated March 2020 (Exhibit 1), stating the following:

During a pump capacity test, performed in April of 2020 on the Main Well, the static water level was measured at 12.5 feet (below ground surface) and the stable pumping level was 22.8 feet (below ground surface). After 4 hours of testing, a short recovery period of only 30 minutes was observed following the cessation of pumping, as the fluid level rose quickly back to the starting static water level (12.6 feet) (Exhibit 1, Main Well pages 4 – 5: Pump Test Data in Appendix).

During a pump capacity test performed on the Moonshine #1 well, the static water level was recorded at 25 feet below grade (below ground surface); well below the elevation of nearby Nojoqui Creek (Exhibit 1, Main Well pages 5 – 6: Pump Test Data in Appendix).

A pump capacity test was attempted on the Moonshine #2. However, no static water level was reported, nor a recovery water level following an abbreviated pump test (Exhibit 1, Main Well pages 5 – 6: Pump Test Data in Appendix).

The Main Well pumps from 22 feet below ground surface (ft bgs) to 76 ft bgs. Moonshine #1 pumps water from 60 ft bgs to 180 ft bgs. And, Moonshine #2 pumps water from 51 ft bgs to 800 ft bgs. In all three wells, the water producing portion of the stratigraphy includes the Quaternary Alluvium sediments, which are within the definable bed and banks of the subterranean stream channel.

All three wells described in the Proposed Project are constructed such that there is no physical means to prevent groundwater flowing in the subterranean channel from being pumped, and therefore the pumped waters are within the jurisdiction of the SWRCB and **are subject to the surface water Numeric and Narrative Instream Flow Requirements.**

FINDINGS

Newton Geo-Hydrology Consulting Services has collected and compiled existing information to develop an understanding of the Nojoqui Creek and Moonshine Creek Alluvium geology, identify structural geology features, and geomorphic features. Available well logs were compiled and evaluated to determine the extent of the Nojoqui and Moonshine Creek alluvium deposits and its water. This site specific data was considered in the context of the State Water Resources Control Board - Cannabis Cultivation Policy which addressed the use of stream flow diversions for cannabis cultivation.

It has been determined that the water pumped from the Main Well, Moonshine Well #1 and Moonshine Well #2, as described for the proposed cannabis cultivation project in Land Use Permit No. 19LUP-00000-00530, **is subterranean stream flow of the Nojoqui Creek and Moonshine Creek** occurring in a known and definite channel. The subterranean channel has relatively impermeable bed and banks, a course that is known by evaluation of the geologic setting and Water Well Drillers Reports, and has groundwater flowing in it. **Therefore, the proposed project must follow to the State Water Resources Control Board (SWRCB) Cannabis Cultivation Policy, and the proposed pumping must adhere to the Numeric and Narrative Instream Flow Requirements established in this Policy (Cannabis Cultivation Policy: Attachment A, Section 3, dated February 5, 2019).**

WATER SOURCE & WATER DEMAND (Revised)
NOJOQUI FARM CANNABIS PROJECT
1889 S. Highway 101, Buellton, CA
MARCH 2022

PROJECT DESCRIPTION

The Nojoqui Farm cannabis project is located approximately 3.5 miles south of the City of Buellton in Santa Barbara County, California (Figures 1A). The project consists of up to 25.93 acres of various cannabis operations, including 21.55 acres of outdoor cultivation under hoops, 2.61 acres of outdoor cultivation without hoops and 1.54 acres of nursery cultivation under hoops. The project will be located on the Nojoqui Farm property (APN 083-430-014) at 1889 US Highway 101, Buellton, California. There is an existing water delivery system that has been in place for over 50 years that delivers water primarily to this property (consisting of 53 acres), but also to the adjacent 33 acre property (083-430-031). These parcels are collectively referred to as the Nojoqui Property. This system consists of three water wells and separate components for agricultural use and for domestic (potable) use.

This memorandum analyzes (1) whether the water system produces water from or impacts Nojoqui Creek, and (2) the overall project water demand. In response to (1), the evidence shows that the water system does not impact Nojoqui Creek but produces water from a groundwater source not a riparian source, and (2) the project water demand is 24.4 acre-feet per year (AFY), which is a significant reduction in the baseline water consumption compared to the historical organic farming operations.

LOCATION

The subject property lies in the southwestern part of Santa Barbara County, California within the east-west trending Santa Rosa Hills, which comprise the foothill area along the north flank of the Santa Ynez Mountains (Figure 1B). The parcels are situated between US Highway 101 on the east and Nojoqui Creek on the west, lying 4 miles south of Buellton and 4 miles north of Gaviota Pass (Figure 2). The area topography varies greatly from 500 feet in the narrow creek floodplains to greater than 2400 feet along the mountain ridges to the south (Figure 4). The two Nojoqui parcels consist of 53 acres and 33 acres respectively; the project will be located

entirely on the 53 acre parcel (083-430-014). The range of elevation for this generally flat-lying property is 560 to 600 feet above sea level. Land use in this area surrounding and including the Nojoqui parcels is primarily row crops, while the more steeply sloping area properties are utilized for grazing.

GEOHYDROLOGY

Geologically, the Nojoqui Farm parcels are located in an east-west trending fold belt that makes up the northern flank of the Santa Ynez Mountains. The area is underlain primarily with consolidated older sediments of the Cretaceous and Mid-Tertiary aged rocks (Figure 5). These Mid-Tertiary rocks, including the Matillja, Cozy Dell, Gaviota and Sacate Formations, typically do not contain large volumes of groundwater, lacking enough porosity and permeability to hold significant water (Figure 6A&6B). However, where these units do contain water is usually associated with overlying groundwater, such as that found in alluvial sediments in rivers, streams and drainages. In the older sediments water quantity is typically smaller and the water quality is fair (non-potable). To the north in the Santa Ynez River Basin the primary water-bearing sediments are usually part of the recent Alluvium and the Plio-Pleistocene Careaga and Paso Robles Formations. However, in the Nojoqui Farm area the sands and gravels of the Careaga and Paso Robles units are absent in the region south of the Santa Ynez Basin having been eroded off and/or never deposited here. Consequently, the primary ground water sources here are the shallow alluvial sediments that overlie the older rocks. Varying in thickness from 10 feet to 200 feet, these alluvial sediments have formed over time due to erosion of the surrounding older rocks and the deposition of eroded clays, silts, sands and gravels into the low-lying areas within the drainages of the local creeks and streams. A regional cross section (Figure 7) shows the disposition of the younger sediments and their relationship to the complex, tectonically folded and faulted older sediments associated with the Santa Ynez Mountain Range to the south. A second north-south cross section shows the local details of the above-mentioned shallow sediments relative to the underlying older rocks (Figure 8).

Hydrologically, the Nojoqui property is located outside of any State Water Resources Control Board designated groundwater basin and is well south (3.5 miles) of the Santa Ynez River Basin. However, the subject land is within a small intermontane basin where ground water is associated with an erosional depression of limited extent containing various thicknesses (10-200 feet) of young, Quaternary alluvial sediments associated with the area's streams, creeks

and drainages. The Nojoqui Farm is bordered on the west by Nojoqui Creek and the east by US Highway 101.The primary ridgeline of the Santa Ynez Mountain Range lies between the subject property and the Pacific Ocean, which directs runoff from the significant drainage to the north toward the Santa Ynez River. The estimated watershed for the Nojoqui Creek is approximately 20 square miles, a fairly large drainage area for a small basin. Consequently, recharge to the area alluvial aquifers is mostly from winter rainfall/runoff and creek water infiltration, as well as some contribution from area irrigation seepage.

Additional details on the local geohydrology can be found in the hydrology report prepared for Santa Barbara County Environmental Health Services as a part of the application/permit for a Single Parcel Water System (SPWS) (See Appendix). This hydrology report can be made available if needed with this Water Source & Water Demand Report.

WATER SYSTEM SUMMARY

The existing water system for Nojoqui Farm has been in place since the mid-1960's and consists of three water wells and an associated water distribution system as described below. The Nojoqui Farm water system services both the domestic (potable water) side of the system, as well as the agricultural (irrigation) components. The domestic portion of the system was recently permitted with Santa Barbara County as a single parcel water system, which supplies water to two connections, the primary farmhouse and the packing shed/office. The irrigation side of the system is separated from the domestic portion in order to prevent any cross contamination (see plot plan in Appendix). The irrigation system currently reaches across the entirety of the primary Nojoqui parcel (APN 083-430-014) and into the adjoining 33 acre property (APN 083-4430-031) to the north as well, which is also under contract to Nojoqui Farm.

The primary water source for this system is the Main Well, which is located within an easement on a separate parcel, APN 083-430-015, known as the Well Property (Figure 3). This Well Property was subdivided from the Nojoqui Property (APN 083-430-014) in 1964 and included easements for the Main Well and the associated water system pipeline. In 1965 the main farmhouse was built, and the various parts of the water system were constructed over the years to serve both the agricultural and domestic needs of the Nojoqui Property. Based on a review of historical records, it is my understanding that the Main Well has exclusively been used for the Nojoqui Property.

MAIN WELL

The Nojoqui Farm Main Well was drilled in 1964 to a depth of 76 feet. The well was completed with 8-inch steel casing to a depth of 55 feet. The production perforations were steel (Mills) knife cut from 44 ' to 49', which corresponds to a permeable water zone at the same depth. The standing level or static level following the completion of this well was measured at 30 feet (Well Completion Report in Appendix). However, it is likely that the older sediments from 50 feet to 76 feet are also contributing groundwater to the Main Well's productive capacity, as there is no restriction to potential flow from the bottom of the casing at 55 feet and from the sediments in the open borehole below the casing. A cement sanitary seal was placed in this well from 22 feet to the surface. The primary purpose of this seal is to prevent any surface or near surface water from entering the well and to prevent any potential contamination from wildlife.

A pump capacity test was performed in April of 2020 on the Main Well. The well was pumped continuously for a period of 4 hours at an average flowrate of 100+ gallons per minute (gpm). While the well is capable of producing at a higher rate (approx.. 150-250 gpm), there was no reason to pump the well at a maximum rate since the actual specific capacity of the well was unknown before the testing. The lower flowrate of 100+ gpm was also chosen so as to not overflow the 30,000 gallon storage tank during testing. In addition, Santa Barbara County EHS allows the onsite hydrologist to determine the needed pumping period and pumping rate when a well has a stable pumping rate of over 50 gpm. Likewise, State and County regulations do not allow extracted water during a test to flow on the ground near a riparian area.

The static water level was measured at 12.5 feet and the stable pumping level was 22.8 feet after 4 hours of testing. The well was also produced into the existing storage tank during the test, in order to avoid flowing the well onto the ground and into the riparian area, which is prohibited by both State and County regulations. Four hours of testing resulted in a stable pumping level and at the time was considered adequate to establish the overall capacity of this well to produce water over the long term. A short recovery period of only 30 minutes was observed following the cessation of pumping, as the fluid level rose quickly back to the starting static water level (12.6 feet) (pump Test Data in Appendix).

Due to the proximity of the Main Well to Nojoqui Creek, monitoring of the surface water level in the creek occurred during the pump testing of the Main Well. No significant changes were observed in the creek level other than minor fluctuations (less than ¼ of an inch) that would normally occur during the day due to changes in sunlight, changes in daily temperature and evaporation rate, and changes in atmospheric pressure. The static levels of two nearby wells

were also monitored. A shallow well open to the atmosphere and containing no pump, no piping and no electrical, known as the Wishing Well, is located 80 feet from the Main Well to the northwest. A second idle well (Farmhouse) 700 feet to the northeast behind the primary farm residence of Nojoqui Farm was also monitored. A drop of 0.5 inches in the static level was observed in the Wishing Well, however the static level returned to the beginning level within 5 minutes after pumping stopped.

During testing no change occurred in the Farmhouse Well. A water sample was taken at the end of the Main Well testing and submitted to Fruit Growers Lab for analysis. The water passed for all of the drinking water constituents necessary to establish this water source as potable.

SECONDARY WELLS

Two additional water wells are available to serve the subject Property. These wells are located on an adjacent property to the north, which is a 33 acre parcel (APN 083-430-031) that is also being purchased by the applicant, Nojoqui Farm and is referred to as the Sunburst property. Historically, the wells have been utilized as an irrigation supply for organic farming on both the Nojoqui Farm parcel and the Sunburst parcel and are tied into these lands via an existing easement and pipeline system over Nojoqui Creek. This has allowed water to flow to both parcels, depending on the needed water demand of each parcel. A map of the these well locations and the pipeline system is included in the Appendix.

Known as Moonshine #1 and Moonshine #2, these wells both produce water from the older sediments, not the younger alluvial sediments (Well Completio Reports in Appendix). Moonshine 1 was drilled in November of 1995 to a total depth of 180 feet. The well was completed with 6 inch steel casing run to 180 feet. The perforated or screened interval was 60 feet to 180 feet. A cement sanitary seal was placed from 60 feet to the surface. A 12 hour pump test on this well recovered water at a rate of 50 gallons per minute (gpm). Additionally, the well location is on the edge of the Tertiary Cozy Dell Formation outcrop (surface) so some of the shallow penetrated sediment layers are likely erosional remnants of the older sediments that are not connected to Nojoqui Creek (Well Completion Report in Appendix). The Moonshine #1 is located 500 feet from Nojoqui Creek. The static water level was recorded at 25 feet below grade; well below the elevation of nearby Nojoqui Creek. The Moonshine #2 Well was drilled in October of 2016 to a total depth of 800 feet. The well was completed with 6-inch PVC casing that was landed at 800 feet. The well's screened interval was from 260 to 800 feet

with a 51 foot cement sanitary seal. Consequently, there is no connection to the creek, as the shallow alluvial sediments are cemented off by the seal and therefore are not included in the perforated interval. This well yielded 25 gallons per minute on an abbreviated pump test. Chemical analyses on the water extracted from the Moonshine #2 was performed in 2016 and again in 2020 indicated a decent water quality for agricultural purposes. However, the water would require some treatment in order to be utilized for domestic purposes.

Permitting and planning for an additional back-up well on the Nojoqui parcel (APN 083-430-014) has been completed with an estimated completion date of June 2022. This well has been permitted and planned for the Property and will be located near the idled water well behind the farmhouse. At this time no projected water flowrates or volumes for this future well have been added to the project. The existing wells are more than adequate to meet the project water demand, so this proposed well will only be a back-up for cultivation at Nojoqui Farm.

ORIGIN OF PRODUCED WELL WATER

One of the primary questions being addressed here is whether the water supplied to the Nojoqui Farm operations is surface water or groundwater. The answer is percolating groundwater. The evidence supporting a determination of a groundwater is as follows:

1. The recent pump test on the Main Well showed no influence on the nearby Nojoqui Creek. The creek level and the static levels of two nearby wells were monitored throughout the test period and no significant changes were observed.

2. Following the termination of the Main Well pump test, a 30 minute recovery period was observed with the water level returning to the static level measured at the beginning of the pump test. A failure of the recovered water level to return to the depth of the beginning static level would have indicated a major loss of water from the aquifer and a subsequent drop in the creek level. None was observed.

3. When the Main Well was drilled and completed the static level was 30 feet below grade, which is well below (26 feet) the elevation of the surface water in Nojoqui Creek, indicating a lack of a direct connection in the subsurface with the creek surface waters.

4. The subject Nojoqui Main Well contains a confining clay layer from near surface to 37 feet. This clay layer is mostly impermeable and will not readily transmit water downward into the water-bearing sediments below it. This clay zone likely also confines the subsurface flow from communicating directly with the surface flow (Figure 10).

5. In support of Statement #4 above, there are different water chemistries between the surface water of the creek and the water-bearing sediments below the confining clay layer. The chemical analysis on the creek surface water is pending, but a hand-held Total Dissolved Solids (TDS) meter indicated a TDS or salinity level of 300 parts per million (ppm) versus 860 ppm for the recently tested groundwater being produced from the Main Well. A significantly different value for salinity further indicates that the subsurface water produced by the Main Well is not communicating at this location with the surface waters from the Nojoqui Creek.

6. One of the key tests for determining whether the Nojoqui Well is producing surface water versus groundwater is the four-part Garrapata test (SWRCB), which states that for water flow to be classified as a subterranean stream flowing through a known and definite channel, the following physical conditions must exist: (a) a subsurface channel must be present; (b) the channel must have a relatively impermeable bed and banks; (c) the course of the channel must be known or capable of being determined by reasonable inference; and (d) water must be flowing in the channel.

   In the case of the Nojoqui Well the hydrogeological conditions that exist do not meet the Garrapata criteria of Parts b and d. The channel of Nojoqui Creek is underlain by permeable sediments of the Tertiary Sacate/Gaviota Formation, which is water-bearing and productive in area water wells to the north of the subject Nojoqui Main Well; and likely contributes groundwater to the overall flow from the Main Well. As for Part d, the subsurface water within the alluvial sediments penetrated by the Nojoqui Well does not continue flowing north in conjunction with the Nojoqui Creek surface water, which flows north 3.5 miles to the Santa Ynez River. The subsurface water in the alluvial sediments below the confining layer is ponded behind the area's older sediments which outcrop at the surface north of the Nojoqui Main Well. This bathtub effect is shown in the north-south cross section in Figure 10.

HISTORIC WATER DEMAND

Nojoqui Farm was a certified organic farm from 1992 to 2017. The detailed water consumption records for 2010 through 2016 have been reviewed and are incorporated into this report (Appendix). The total water usage from 2010 -2016 averaged 106 AF per year. However, only the water use from the Main Well was recorded as the backup wells, Moonshine #1 and Moonshine #2 did not have flowmeters installed and only were used to irrigate the northern 33 acre parcel. The total amount of irrigated acreage from 1992 to 2017 varied from 40 acres to 65 acres; 25-28 acres on the primary parcel (APN 083-430-014) and 18-40 acres on the two adjacent parcels (APN 083-430-031 and -035). After the death of the lead grower/farm manager in 2017 the organic farming operation ceased to exist. In its place approximately 20-25 acres of oat hay was grown instead of row crops in 2017-2018. Unfortunately, there are no detailed records for water use in those years, but an estimate of 50-75 AFY is being supplied based on a water use factor of 2.5-3.0 AFY/acre for oat hay. The property was farmed in hemp in 2019, but only on a limited basis (5 acres) with an estimated water consumption of 9 AFY. The farm ground was left fallow in 2020. Combining all of the water consumption estimates and records from 2010 through 2019 (10 years) the average annual water usage was 82 AFY.

PROJECTED WATER USE

The recent UC Ag Extension data for water consumption for row crops in Santa Barbara County lists a value of 2.5 acre-feet per year per acre (AFY/Ac) for these crops. San Luis Obispo County utilizes 1.9 AFY/Ac for these same crops. From researching recent water consumption on several area cannabis operations, it appears as though the water demand estimates for cannabis have been grossly overstated at 1.9 to 2.0 AFY/Ac. A recent cannabis presentation in front of the Santa Barbara County Board of Supervisor by CCA located on Santa Rosa Road in Buellton revealed a demand factor of approximately 0.50 AFY/Ac. This data was based on accurate water metering and recordkeeping and also involved the use of state-of-the-art drip irrigation for in-ground cultivation. Consequently, this project is similar to Nojoqui Farm in that it involves all in-ground cultivation. A second cannabis project also on Santa Rosa Rd. has realized similar results with a demand factor of 0.6-0.7 AFY/Ac. occurring over the last 2 years of in-ground cultivation as well as cultivation in pots. Consequently, the project demand for Nojoqui Farm project has been reduced to 1 AFY/Ac. for the Nojoqui Farm Project. Like the above-mentioned cannabis grow for CCA, the Nojoqui Project is unique in that all of the cultivation here will be in-ground, with no above ground farming in pots and raised beds along

with artificial or manufactured soils. Through discussions with the former crop managers at Nojoqui, it appears as though the watering frequency for years for the organic row crops was every 4 days rather than every 2-3 days as is the case in the Lompoc and/or Santa Maria Valley farming areas. Consequently, it is critical to understand the predominate soil type at Nojoqui Farm and how it affects water usage.

A specific soil type known in the literature as the Sorrento Series is common to the Nojoqui Creek area and covers the surface of the Nojoqui Farm parcels. This soil horizon is described in the USDA's "Soil Survey of Northern Santa Barbara Area, California" as well drained, grayish-brown sandy loam to clayey loam. These soils occur extensively on floodplains and alluvial fans in several areas of Northern Santa Barbara County. This is key to estimating water demand for the project as this soil type consists of a significant content of fines, i.e. silt and clay (30-40 %), and will therefore retain a greater moisture percent than most area soils. This further supports the projected lower water demand for the Nojoqui Farm operations.

Assuming 21.55 acres of outdoor cultivation with hoops and 2.61 acres of outdoor cultivation without hoops, there is a total cultivation area of 24.19 acres. Therefore, the total estimated water demand for the Nojoqui Project is 24.2 AFY. By adding in the projected water consumption for the project landscaping of 0.2 AFY and the total domestic demand of 0.2 AFY, **the total project water demand is 24.6 AFY.** This projected demand is only 30% of the average annual water consumption (82 AFY) that occurred on the property in the last 10 years. If one compares this estimate to the average annual water demand for the organic farming operations from 2010 to 2016 the water estimate for Nojoqui cannabis is 23% of the total annual water (106 AFY) consumed by row crops.

WATERSHED FOR NOJOQUI CREEK DRAINAGE

The overall watershed area for the Nojoqui Creek drainage is shown in Figure 9. The area is quite large for a small basin comprising over 20 square miles. Comparing this drainage area to those listed in the USGS Water Supply Paper 1107 (Upson et. al.), the Nojoqui Creek drainage lies between the Jameson Lake (18 sq. mi's) and Gibraltar Dam (219 sq. mi's) areas. However, due to its location near the ridgeline of the Santa Ynez Mountains above Santa Barbara, both Jameson Lake and the area of Nojoqui Creek normally experience higher rainfall amounts. Therefore, the runoff measurements at the Jameson location are more applicable. Consequently, the runoff attributed to the Nojoqui Creek drainage area is assumed to be approximately that of Jameson Lake or an average of 6080 AF annually.

Additionally, the geologic setting for the Nojoqui Creek area is similar to both Jameson and Gibraltar in that runoff occurs over predominately older rocks and sediments of the Cretaceous Jalama Formation up through the Late Miocene Monterey Formation. This results in a greater percentage of total rainfall and runoff occupying the creek, streams and riverbeds and their associated shallow alluvial sediments rather than infiltrating into any available deeper groundwater aquifers, as is the case with the Paso Robles and Careaga Formation in central and northern Santa Barbara County. In addition, this condition of less permeable, older rocks underlying the watershed does lend itself to greater evaporation. Consequently, it is assumed that at least 30% of the total runoff for the Nojoqui Creek drainage is lost to evaporation, 40% is attributed to creek and stream surface flow that continues to the north into the Santa Ynez River Drainage Basin, and 30% is directed into water storage within alluvial sediments or aquifers lying under the Nojoqui Creek drainage area.

CONCLUSIONS

1. There is an existing water delivery system and Main Well that has been serving the Nojoqui Farm properties for over 50 years without any significant impacts to nearby Nojoqui Creek.

2. The Nojoqui Main Well was drilled and completed in December of 1964 for the sole benefit of the Nojoqui Property. The existing water system consists of separate components, one for domestic service and the other for agricultural service.

3. The Main Well is producing groundwater from Recent alluvial sediments as well as older permeable sediments of the Sacate/Gaviota Formation.

4. A pump test on the Main Well produced at a rate of 100 gpm with no detected impacts to the surface waters of Nojoqui Creek 130 feet away. There is significant evidence that confirms that there is minimal influence by the pumping of the Main Well on the surface waters of the creek, including a confining clay layer, differing water chemistries between the surface water and the subsurface water, and differing static levels. In addition, no significant changes occurred in the static levels of two additional wells that were monitored during the testing.

5. The Nojoqui Main Well does not meet the requirements for subterranean flow as determined by the State Water Resources Board in the four-part Garrapata standards; lacking impermeable beds and banks and the subsurface water is not flowing in the channel.

6. The historic water demand for the prior organic farming operations at the Nojoqui parcels (Nojoqui Property) from 2010 through 2016 was 106 AFY; the 10 year average was 82 AFY.

7. The estimated water demand for the Nojoqui Farm cannabis operation is 24.1 AFY. This represents a reduction in water consumption of 75% relative to the historical water demand of the organic farming operation.

8. The productive capacity of the Main Well (150-200 gpm) and the two secondary wells (40-50 gpm) will provide a more than adequate supply of water to meet the water demand of 24.6 AFY for the Nojoqui Project. In fact, the capacity of the Main Well alone is sufficient to meet the project water demand. This assumes two crops per year and a total growing season of 150 days.

It is important to note that the Nojoqui parcels are not located within the Santa Ynez River Basin (3.5 miles to the north) and are not within any State recognized groundwater basin. Therefore, there isn't a reason to apply the County's Water Thresholds. Additionally, the overall project demand is 70-75% lower than the historical averages for the Nojoqui Property.

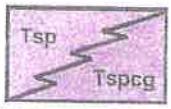
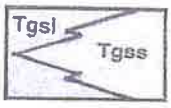
VAQUEROS SANDSTONE
shallow marine transgressive; early Miocene age
Tvq *north of Santa Ynez fault: greenish-tan sandstone and interbedded greenish siltstone, with local calcareous lenses; south of Santa Ynez fault: light gray calcareous sandstone*
★**Tvqcg** *greenish-brown sandstone and pebble conglomerate composed mostly of Franciscan detritus*



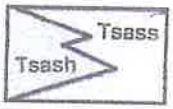
SESPE FORMATION
nonmarine; predominantly Oligocene age
Tsp *gray to tan sandstone and green to red siltstone and claystone; basal part intertongues westward with Alegria Formation south of Santa Ynez fault*
★ **Tspcg** *greenish-gray to reddish conglomerate composed mostly of Franciscan and ultramafic (peridotite) detritus; unconformity at base*

♦ **ALEGRIA FORMATION**
shallow marine regressive; Oligocene age
Ta *tan, arkosic sandstone and greenish-gray siltstone, locally fossiliferous; intertongues eastward into lowest part of Sespe Formation; lower Zemorrian and Refugian Stage*



♦ **GAVIOTA FORMATION**
shallow marine regressive; early Oligocene age
Tgss *hard, thick bedded tan arkosic sandstone, locally fossiliferous, and minor gray siltstone; Refugian Stage*
Tgsl *gray concretionary siltstone and claystone*

♦ **GAVIOTA — SACATE FORMATIONS**
Tg-sa *Gaviota or Sacate Formations, undifferentiated*



♦ **SACATE FORMATION**
marine; late Eocene age
dark gray micaceous clay shale and siltstone interbedded with hard, light gray to tan arkosic sandstone; Narizian Stage
Tsass *predominantly sandstone* **Tsash** *predominantly shale*

Ec

MATILIJA (?) SANDSTONE
marine; middle to late Eocene age
Tma *hard, thick bedded, tan arkosic sandstone with thin partings of gray micaceous shale*

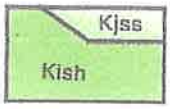
♦ ANITA SHALE
marine; early(?) to middle Eocene age
Tan *medium to dark gray micaceous clay shale with rare thin sandstone strata; includes a bed of red to green foraminiferal claystone ("Poppin Shale")*

★ SIERRA BLANCA LIMESTONE
shallow marine transgressive; early(?) Eocene age
Tsb *white algal limestone, commonly sandy; disconformity at base*

UNCONFORMITY

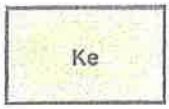
CRETACEOUS

Upper



♦ JALAMA (?) FORMATION
marine; late Cretaceous age
Kjss *hard, tan arkosic sandstone with thin partings of dark gray micaceous shale*
Kjsh *hard but fractured dark gray micaceous shale; rare thin hard strata of sandstone, and conglomerate of black chert pebbles*

Lower



★ ESPADA FORMATION
marine; late Jurassic (?) to early and middle (?) Cretaceous age
Ke *dark gray, hard but fractured micaceous shale with thin interbeds of hard, olive-gray arkosic sandstone, minor pebble conglomerate, and thin, dark gray carbonate strata*

THIS FORM FURNISHED BY SECURITY TITLE INSURANCE COMPANY

FOR A VALUABLE CONSIDERATION, receipt of which is hereby acknowledged,

[illegible] E. FLANAGAN and ALISON M. FLANAGAN, his wife

hereby GRANT(S) to

EDWARD [illegible] [illegible] and [illegible] [illegible], his wife, as joint tenants

A part of the Rancho Nojoqui, in the County of Santa Barbara, State of California, as granted by the United States of America to Raymundo Carrillo, by Patent dated September 12, 1869, and recorded in Book "A" at Page 779, et seq., of Patents, in the office of the County Recorder of said County, and particularly described as follows:

Beginning at a point in Line No. 9 of the Final Survey of said Rancho Nojoqui, at the corner common to Section 31, Township 6 North, Range 31 West, S. B. & M., and Section 36, Township 6 North, Range 32 West, S. B. & M., from which point of beginning the corner common to Section 31, Township 6 North, Range 31 West, S. B. & M., and Section 36, Township 6 North, Range 32 West, S. B. & M., in the Township line between Township 6 North and Township 5 North bears South 731.5[illegible] feet distant, and from which last described point the corner common to Sections 1 and 2, Township 5 North, Range 32 West, S. B. & M., bears East 392.70 feet distant; thence from said point of beginning, 1st, East 75.58 feet along said Line No. 9 of the Final survey of said Rancho Nojoqui and along the South line of said Section 31, Township 6 North, Range 31 West, S. B. & M., to a point in the Westerly line of a certain county road; thence along same, 2nd, North 1°30' West 1118.04 feet to a point in the center line of a gulch near the West side of a bridge; thence 3rd, East 11.22 feet to a point in the center line of said county road; thence along same, 4th, North 37° West 99 feet to a point at an angle in the center line of said county road; thence 5th, North 35°03' West 105.30 feet to a point at another angle in said county road; thence 6th, North 33°35' West 400 feet to a point; thence leaving the center line of said County road, 7th, North 57°15' West at 156.50 feet, a point in the center line of a deep gulch at the most Southerly corner of that certain parcel of land as particularly described in the Deed to Eduardo de la Cuesta to E. S. Cordero, dated March 13, 19[illegible] and recorded in Book 100 at Page 7[illegible], et seq., of Deeds, in the office of the County Recorder of said County, 169.50 feet to a point; thence along the Westerly line of said parcel of land, as described in said Deed to Eduardo de la Cuesta to E. S. Cordero, by the following 16 courses and distances: 8th, North 37°30' West 10[illegible].[illegible] feet to a point; thence 9th, North 3°15' East 78.70 feet to a point; thence 10th, North 46°30' West 51.20 feet to a point; thence 11th, North 12°10' West 75.30 feet to a point; thence 12th, North 5[illegible]° West 56 feet to a point; thence 13th, North 19°70' West 51.40 feet to a point; thence 14th, North 15°17' East 107 feet to a point; thence 15th, North 13°51' East 64.60 feet to a point; thence 16th, North 33°55' East 56.[illegible] feet to a point; thence 17th, North 6[illegible]°4[illegible]' East 69 feet to a point; thence 18th, North [illegible]°10' West [illegible].[illegible] feet to a point; thence 19th, North 33°45' East 73.[illegible] feet to a point; thence 20th, North 20°29' West 77 feet to a point; thence 21st, North 15° West 153.80 feet to a point; thence 22nd, North 19°30' West 1[illegible].50 feet to a point; thence 23rd, North 42°30' East 38.50 feet to the confluence of said deep gulch and that certain creek locally known as and called Nojoqui Creek, from said point of confluence two willow trees marked "[illegible]," bears North 6[illegible]°[illegible]' West 12.90 feet distant, and North 4[illegible]°30' West 32.50 feet distant, respectively; thence up the center line of said Nojoqui Creek, following its meanders by the following [illegible] courses and distances: 24th, East 33 feet to a point; thence 25th, South 40° West 3[illegible] feet to a point; thence 26th, South 10° West 1[illegible] feet to a point; thence 27th, South 39° West 1[illegible].[illegible] to a point; thence 28th, South 54° West 140.58 feet to a point; thence 29th, North 68°30' West 137.[illegible] feet to a point; thence 30th, South 8° East 130 feet to a point; thence 31st, South 6°30' West 135 feet to a point; thence 32nd, South 13° West 264.00 feet to a point; thence 33rd, South 41° West 111.56 feet to a point; thence 34th, South 67°30' East 135.9[illegible] feet to a point; thence 35th, South 12° West 104 feet to a point; thence 36th, South 5° West 264 feet to a point; thence 37th, South 46° West 144.5[illegible] feet to a point; thence 38th, South 14° East 190 feet to a point; thence 39th, South 43° East 99 feet to a point; thence 40th, South 73°45' East 157.74 feet to a point; thence 41st, South 12° East 321.42 feet to a point; thence 42nd, South 65° East 56 feet to a point; thence 43rd, South 8°[illegible]' West 165 feet to a point; thence 44th, South ...

to a point; thence 46th, South 23° West 108.90 feet to a point, thence 47th, South 20° East 33 feet to a point in said line No. 9 of the final survey of said Rancho Nojoqui; thence along same, 48th, East 962.28 feet to the point of beginning.

EXCEPTING therefrom so much thereof as has been conveyed to the State of California for highway purposes, including the portion conveyed by the Deed dated April 8, 1954, and recorded May 24, 1955 as Instrument No. 9257, in Book 1316 at Page 286 of Official Records.

ALSO EXCEPTING therefrom 1/2 of all oil, gas or other hydrocarbon substances in, under or upon said land, as reserved in the Deed from Sylvia C. McMartin, also known as Cecelia McMartin and Sylvia McMartin, Narcelus Clinton, Josephallen Manes, Cecelia Mouhleau and Mary Lois Mouhleau, recorded May 1st, 1951, as Instrument No. 7747, in Book 991 at Page 288 of Official Records.

Excepting and reserving unto the grantors herein, for the period of their lives plus twenty-one years, an undivided one-half interest in and to all oil, gas, petroleum and other hydrocarbon substances, minerals and water in, under or recoverable from the portion of subsurface of the above described land lying below a plane parallel to and 500 feet vertically below the surface of said land, without, however, the right to enter upon the surface of said land or any portion thereof lying above a plane parallel to and 500 feet vertically below the surface of said land.

Also Excepting Therefrom that portion thereof described as follows:

Beginning at Southwest corner of Parcel One above described parcel, being a point on line No. 9 of said Rancho Nojoqui; thence, along the west line of said parcel the following courses and distances: North 16° West, 33 feet; thence North 23° East, 108.90 feet; thence North 10° West 72.60 feet; thence North 54°30' West, 165 feet, thence North 8°30' East 165 feet; thence leaving said Westerly line South 89° 45' 31" East, 521.49 feet to a point from which said line No. 9 of Rancho Nojoqui bears South 0° 18'53" West, 463.13 feet; thence South 0°18'53" West, 463.13 feet to a point on said Line No. 9 from which the point of beginning bears West, 431.01 feet; thence along said Line No 9 West 431.01 feet to the point of beginning.

PARCEL TWO

An easement and right of way for water well sight purposes, pumping plant and incidentals thereto over, under, upon, and through the following described land: Beginning at the Southwest corner of Parcel one above described; thence along the Westerly line of said Parcel one North 16° West 33 feet; thence continuing along said Westerly line North 23° East, 28.83 feet; thence leaving said Westerly line North 85°34'45" East, 130.40 feet; thence South 3°01'45" West 66.50 feet to a point on said Line No. 9 from which the point of beginning bears West 99 feet; thence along said Line No. 9 West 99 feet to the point of beginning.

EXCEPTING AND RESERVING from PARCEL ONE above an easement for road, public utilities purposes, ingress and egress over, under, along and upon a strip of land 30 feet in width lying adjacent to and Northerly of the Northerly of said Parcel One, excepting that portion thereof lying within the lines of PARCEL TWO herein.

PARCEL THREE:

[redacted] An easement for water line purposes, repairs and maintence the same, over, under, upon and along a 10 foot strip of land described as follows commencing at the southwest corner of Parcel One herein described thence North 0°14'53" East 21.45 feet to the beginning of the center line of said 10 foot easement; thence south 89°37'36" west 35.72 feet; thence north 61°08 west 55.00 feet; thence south 35°07 west 40.50 feet; thence south 86°55' West 97.00 feet; thence North 50°47' West 83.55 feet to appoint on the east line of Parcel two here and above described said point being South 3°01'45" west 6.00 feet from the southeast corner of said Parcel two.

In Book 68 at Page 90 of Record of Surveys, appears a map of the herein described land.

EXHIBIT A

(Legal Description)

The land situated in the State of California, County of Santa Barbara, City of Buellton and is described as follows:

PARCEL ONE:

A part of the Rancho Nojoqui, in the County of Santa Barbara, State of California, as granted by the United States of America to Raymundo Carrillo, by patent dated September 11, 1869, and recorded in Book "A" at Page 779, et seq., of Patents, in the office of the County Recorder of said County, and particularly described as follows:

Beginning at a point in Line No. 9 of the Final Survey of said Rancho Nojoqui, at the corner common to Section 31, Township 6 North, Range 31 West, S. B. & M., and Section 36, Township 6 North, Range 32 West, S. B. & M., from which point of beginning the corner common to Section 31, Township 6 North, Range 31 West, S. B. & M., and Section 36, Township 6 North, Range 32 West, S. B. & M., in the township line between Township 6 North and Township 5 North bears South 701.58 feet distant, and from which last described point the corner common to Sections 1 and 2, Township 5 North, Range 32 West, S. B. & M., bears East 392.70 feet distant; thence from said point of beginning, 1st, East 76.58 feet along said Line No. 9 of the Final Survey of said Rancho Nojoqui and along the South line of said Section 31, Township 6 North, Range 31 West, S. B. & M., to a point in the Westerly line of a certain county road; thence along same, 2nd, North 1°30' West 1118.04 feet to a point in the center line of a gulch near the West side of a bridge; thence 3rd, East 11.22 feet to a point in the center line of said county road; thence along same, 4th, North 17° West 59 feet to a point at an angle in the center line of said county road; thence 5th, North 35°03' West 195.50 feet to a point at another angle in said county road; thence 6th, North 14°35' West 408 feet to a point; thence leaving the center line of said county road, 7th, North 67°15' West at 156.50 feet, a point in the center line of a deep gulch at the most Southerly corner of that certain parcel of land as particularly described in the deed to Edwardo De La Cuesta to E. S. Cordero, dated March 10, 1904 and recorded in Book 100 at Page 72, et seq., of Deeds, in the office of the County Recorder of said County, 169.50 feet to a point; thence along the Westerly line of said parcel of land, as described in said deed to Edwardo De La Cuesta to E. S. Cordero, by the following 16 courses and distances: 8th, North 37°20' West 147.30 feet to a point; thence 9th, North 3°15' East 78.70 feet to a point; thence 10th, North 48°30' West 51.20 feet to a point; thence 11th, North 12°10' West 76.30 feet to a point; thence 12th, North 54° West 55 feet to a point; thence 13th, North 19°30' West 51.40 feet to a point; thence 14th, North 25°17' West 109 feet to a point; thence 15th, North 13°51' East 84.80 feet to a point; thence 16th, North 33°55' East 56.60 feet to a point; thence 17th, North 61°47' East 69 feet to a point; thence 18th, North 6°10' West 91.80 feet to a point; thence 19th, North 13°45' East 73.20 feet to a point; thence 20th, North 20°25' East 77 feet to a point; thence 21st, North 15° West 153.80 feet to a point; thence 22nd, North 18°30' West 136.50 feet to a point; thence 23rd, North 42°30' East 32.50 feet to the confluence of said deep gulch and that certain creek locally known as and called Nojoqui Creek, from said point of confluence, two willow trees marked "F. B. T." bears North 62°45' West 12.50

feet distant, and North 42°30' East 32.50 feet distant, respectively; thence up the center line of said Nojoqui Creek, following its meanders by the following 23 courses and distances: 24th, West 33 feet to a point; thence 25th, South 40° West 330 feet to a point; thence 26th, South 10° West 132 feet to a point; thence 27th, South 29° West 165 feet to a point; thence 28th, South 44° West 140.58 feet to a point; thence 29th, North 68°30' West 137.28 feet to a point; thence 30th, South 8° East 132 feet to a point; thence 31st, South 8°30' West 165 feet to a point; thence 32nd, South 15° West 264.00 feet to a point; thence 33rd, South 41° West 111.54 feet to a point; thence 34th, South 67°30' West 135.96 feet to a point; thence 35th, South 12° West 264 feet to a point; thence 36th, South 5° West. 264 feet to a point; thence 37th, South 49° West 144.54 feet to a point; thence 38th, South 14° East 198 feet to a point; thence 39th, South 43° East 99 feet to a point; thence 40th, South 73°45' East 157.74 feet to a point; thence 41st, South 22° East 321.42 feet to a point; thence 42nd, South 65° East 66 feet to a point; thence 43rd, South 8°30' West 165 feet to a point; thence 44th, South 54° 30' East 165 feet to a point; thence 45th, South 10° East 72.60 feet to a point; thence 46th, South 23° West 108.90 feet to a point; thence 47th, South 15° East 33 feet to a point in said Course No. 9 of the Final Survey of said Rancho Nojoqui; thence along same, 48th, East 962.28 feet to the point of beginning.

EXCEPTING therefrom that portion thereof as has been conveyed to the State of California, for highway purposes, including the portion conveyed by the deed dated April 4, 1955 and recorded May 24, 1955, as instrument No. 9257 in Book 1316, at Page 226 of Official Records.

ALSO EXCEPTING therefrom that portion thereof described as follows:

Beginning at Southwest corner of Parcel One above described parcel, being a point on Line No. 9 of said Rancho Nojoqui; thence, along the West line of said parcel, the following courses and distances: North 16° West, 33 feet; thence North 23° East, 108.90 feet; thence North 10° West. 72.60 feet; thence North 54°30' West, 165 feet; thence North 8°30' East 165 feet; thence leaving said Westerly line South 89°45'31" East, 521.49 feet to a point from which said Line No. 9 of Rancho Nojoqui bears South 0°14'53" West, 463.13 feet; thence South 0°14'53" West, 463.13 feet to a point on said Line No. 9 from which the point of beginning bears West, 431.01 feet; thence along said Line No. 9 West 431.01 feet to the point of beginning.

ALSO EXCEPTING therefrom 1/2 of all oil, gas or other hydrocarbon substances in, under or upon said land, as reserved in the deed from Sylvia C. McMartin, also known as Cecelia McMartin and Sylvia McMartin, Veronica Clinton, Josephellen Hanse, Cecilia Rouchleau and Mary Lois Rouchleau, recorded May 18, 1951 as Instrument No. 7747 in Book 991 at Page 284 of Official Records.

ALSO EXCEPTING therefrom for the period of their lives plus twenty-one years, an undivided one-half interest in and to all oil, gas, petroleum and other hydrocarbon substances, minerals and water in, under or recoverable from the portion of subsurface of the above described land lying below a plane parallel to and 500 feet vertically below the surface of said land, without, however, the right to enter upon the surface of said land or any portion thereof, lying above a plane parallel to and 500 feet vertically below the surface of said land, as reserved by Peter M. Flanagan, et ux. ,in the deed recorded December 31, 1964 as Instrument No. 54827 in Book 2085, Page 942 of Official Records.

PARCEL TWO:

An easement and right of way for water well site purposes, pumping plant and incidentals thereto over, under, upon, and through the following described land: Beginning at the Southerly terminus of the 47th course of Parcel One hereinabove described; thence Northerly along said 47th course North 15° West 33 feet; thence continuing North 23° East 28.83 feet; thence North 85°34'45" East, 100.40 feet; thence South 3°01'45" West 66.50 feet to a point on said Course No. 9 from which the point of beginning bears West 99 feet; thence along said Course No. 9 West 99 feet to the point of beginning.

PARCEL THREE:

An easement for water line purposes, repairs and maintenance of the same, over, under, upon and along a 10 foot strip of land described as follows: Commencing at the Southerly terminus of the 47th course of Parcel One hereinabove described; thence North 0°14'53" East 21.45 feet to the beginning of the center line of said 10 foot easement; thence South 89°37'36" West 95.72 feet; thence North 61°08' West 55.00 feet; thence South 35°07' West 40.50 feet; thence South 86°55' West 97.00 feet; thence North 50°47' West 83.55 feet to a point on the East line of Parcel Two here and above described, said point being South 3°01'45" West 6.00 feet from the Northeast corner of said Parcel Two.

(3) TYPE OF WORK (*check*):

New well ☒ Deepening ☐ Reconditioning ☐ Abandon ☐

If abandonment, describe material and procedure in Item 11.

(4) PROPOSED USE (*check*):

Domestic ☒ Industrial ☐ Municipal ☐

Irrigation ☐ Test Well ☐ Other ☐

(5) EQUIPMENT:

Rotary ☐

Cable ☒

Dug Well ☐

(6) CASING INSTALLED:

SINGLE ☒ DOUBLE ☐

From	ft. to	ft.	Diam.	Gage or Wall
0	55	2	8	

Type and size of shoe or well ring

Describe joint Weld collar

If gravel packed

Diameter of Bore	from ft.	to ft.

Size of gravel:

(7) PERFORATIONS:

Type of perforator used Mill knife

Size of perforations 1/2 in., length, by 3/8 in.

From	ft. to	ft.	Perf. per row	Rows per ft.
44	48		6	2

(8) CONSTRUCTION:

Was a surface sanitary seal provided? ☒ Yes ☐ No To what depth 22 ft.

Were any strata sealed against pollution? ☐ Yes ☒ No If yes, note depth of strata

From ft. to ft.

Method of Sealing

(9) WATER LEVELS:

Depth at which water was first found ft.

Standing level before perforating ft.

Standing level after perforating 30 ft.

(10) WELL TESTS:

Was a pump test made? ☐ Yes ☒ No If yes, by whom?

Yield: gal./min. with ft. draw down after hrs.

Temperature of water Was a chemical analysis made? ☐ Yes ☒ No

Was electric log made of well? ☐ Yes ☒ No

(11) WELL LOG:

Total depth 75 ft. Depth of completed well ft.

Formation: *Describe by color, character, size of material, and structure.*

0 ft. to	2 ft.	Black soil
2 "	25 "	Yellow clay
25 "	37 "	Sandy blue clay
37 "	39 "	Sandy blue clay and gravel
39 "	45 "	Sandy blue clay
45 "	49 "	Gravel, some blue clay
49 "	75 "	Blue analog some gravel

Work started 19 Completed December 1964

WELL DRILLER'S STATEMENT:

This well was drilled under my jurisdiction and this report is true to the best of my knowledge and belief.

NAME Alexander Bros. (Person, firm, or corporation) (*Typed or printed*)

Address 415 East College Ave.

Lompoc, Calif.

DEPARTMENT OF WATER RESOURCES

WATER WELL DRILLERS REPORT

QUADRUPLICATE
Use to comply with local requirements

Do not fill in

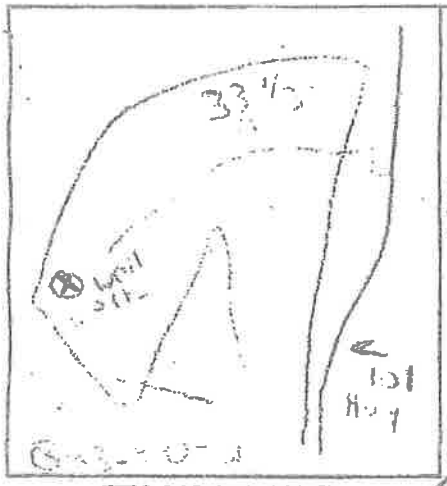
No. 354299

Notice of Intent No. _____
Local Permit No. or Date _____

State Well No. _____
Other Well No. _____

(1) OWNER: Name MC Lucian Valley Farms
Address P.O. Box 130
City Firebaugh CA ZIP 93627

(2) LOCATION OF WELL (See instructions):
County Fresno Owner's Well Number _____
Well address if different from above Hill Rd.
Township 15N Range 13E Section _____
Distance from cities, roads, railroads, fences, etc. _____



WELL LOCATION SKETCH

(3) TYPE OF WORK:
New Well ☒ Deepening ☐
Reconstruction ☐
Reconditioning ☐
Horizontal Well ☐
Destruction ☐ (Describe destruction materials and procedures in Item 12)

(4) PROPOSED USE:
Domestic ☑
Irrigation ☒
Industrial ☐
Test Well ☐
Municipal ☐
Other ☒
(Describe)

(5) EQUIPMENT:
Rotary ☒ Reverse ☐
Cable ☐ Air ☐
Other ☐ Bucket ☐

(6) GRAVEL PACK:
Yes ☒ No ☐ Size #2/12
Diameter of bore 12 3/4
Packed from 60 ft. to 180 ft.

(7) CASING INSTALLED:
Steel ☐ Plastic ☒ Concrete ☐

From ft.	To ft.	Dia. in.	Gage or Wall
0	60	12"	.375

(8) PERFORATIONS:
Type of perforation or size of screen

From ft.	To ft.	Slot size
60	180	.040

(9) WELL SEAL:
Was surface sanitary seal provided? Yes ☒ No ☐ If yes, to depth 60 ft.
Were strata sealed against pollution? Yes ☐ No ☒ Interval _____ ft.
Method of sealing _____

(10) WATER LEVELS:
Depth of first water, if known _____ ft.
Standing level after well completion 25 ft.

(11) WELL TESTS:
Was well test made? Yes ☒ No ☐ If yes, by whom? Cascade
Type of test Pump ☒ Bailer ☐ Air lift ☐
Depth to water at start of test 25 ft. At end of test 122 ft.
Discharge 55 gal/min after 12 hours Water temperature _____
Chemical analysis made? Yes ☐ No ☒ If yes, by whom? _____
Was electric log made Yes ☐ No ☒ If yes, attach copy to this report

(12) WELL LOG: Total depth 180 ft. Completed depth 180 ft.

from ft.	to ft.	Formation (Describe by color, character, size or material)
0	45	Fine: Clay
45	80	Fine: Clay w/gravel
80	180	Fine sand

Work started 11-1 1995 Completed 11-15 1995

WELL DRILLER'S STATEMENT:
This well was drilled under my jurisdiction and this report is true to the best of my knowledge and belief.

☑ No Treatment required ☐ Treatment required
(Attach analysis and indicate treatment equipment on schematic. Treatment form and equipment specifications are required.)

9. LEGAL DECLARATION

LICENSED CONTRACTOR DECLARATION

I hereby affirm that I am a licensed under the provisions of Chapter 9 (commencing with Sec. 7000) of Division 3 of the Business and Professions Code and such license (C-57 or C-61) is in full force and effect.

NOT APPLICABLE (AS BUILT) _____ _____

Print Name of Contractor | Signature of Contractor | Date

Lic. No.: _____ Office Telephone _____ Cell Phone: _____

Business Name: _____ Address _____

10. (Complete 'A' or 'B')

A. WORKERS' COMPENSATION DECLARATION

I hereby affirm one of the following:

- ☐ I have and will maintain a certificate of consent to self-insure for workers' compensation, as provided for by Section 3700 of the Labor Code, for the performance of the work for which this permit is issued.
- ☐ I have and will maintain workers' compensation insurance, as provided for by Section 3700 of the Labor Code, for the performance of work for which this permit is issued. My insurance carrier and policy number are:

Carrier _____ Policy No. _____

Applicant Signature _____ Date _____

B. CERTIFICATION OF EXEMPTION FROM WORKERS' COMPENSATION INSURANCE

I certify that in the performance of work for which this permit is issued, I shall not employ any person in a manner so as to become subject to the Worker's Compensation Laws of California.

Applicant Signature Charles E. Katherman Date 4/26/2021

Notice to Applicant: If, after making this Certificate of Exemption, you should become subject to the Workers' Compensation provisions of the Labor Code, you must forthwith comply with such provisions or this permit shall be deemed revoked.

11. When signed by the Environmental Health Specialist, this application shall become a Permit to Construct a Single Parcel Water System and is not a "permit for development" as that term is used in the California Subdivision Map Act. Approval is based entirely on the review of information submitted by the applicant and is not a guarantee as to the future quality or quantity of water which will be provided by the water system. Permits are valid for three years from the date of issuance. Permits are not transferable. Please note additional permits (e.g., electrical installation, land use clearance, grading) may also be required from other agencies prior to the installation of the water system.

In accordance with the requirements of Santa Barbara County Code, I do hereby make application for a permit to construct a Single Parcel Water System and certify that the above information is true and correct. The permit application must be signed by the parcel owner, his/her agent (with written authorization) or a licensed contractor. A manually signed copy of this application delivered by facsimile, email, or other electronic transmission shall be deemed to have the same legal effect as delivery of an original signed copy of this application.

REQUIRED INSPECTIONS / FINAL CLEARANCE: Prior to final clearance/occupancy:

1. Disinfect and flush the completed water system per EHS instructions.
2. After flushing, a final inspection and bacteriological sampling must be scheduled directly with the approving Environmental Health Specialist at least two (2) business days in advance.
3. Submit a chemical analysis of treated water (if treatment is required).
4. Obtain written occupancy from Environmental Health.

Signed CHARLES E. KATHERMAN Charles E Katherman 4/26/2021

SANTA BARBARA CA 93103

Dear MR. JACKS

Subject: **Completion Report for Water Well Permit #SR0102892**
(Assessor's Parcel Number: 137-300-007)

This Department has reviewed the construction of the subject water well as related to the approval of the location of the well and the placement of the annular seal in the upper portion of the bore around the well casing. This work has been completed in conformity with the requirements of the Water Well Standards of the State Department of Water Resources, as adopted by the Santa Barbara County Water Well Ordinance.

If water from this well is intended to be utilized for domestic or drinking purposes, it will first be necessary to obtain a Water System Permit from this Department. The permit is required for any water system that will provide water to a dwelling unit or to any structure utilized for commercial or manufacturing purposes which requires potable water for human consumption or use.

Please contact the undersigned at the office indicated on this letterhead if you have any questions or if you need a Water System Permit Application and a copy of the instructions for completing the form and for providing the necessary specifications on the system.

Sincerely,

John D. Davies, R.E.H.S.
Environmental Health Specialist

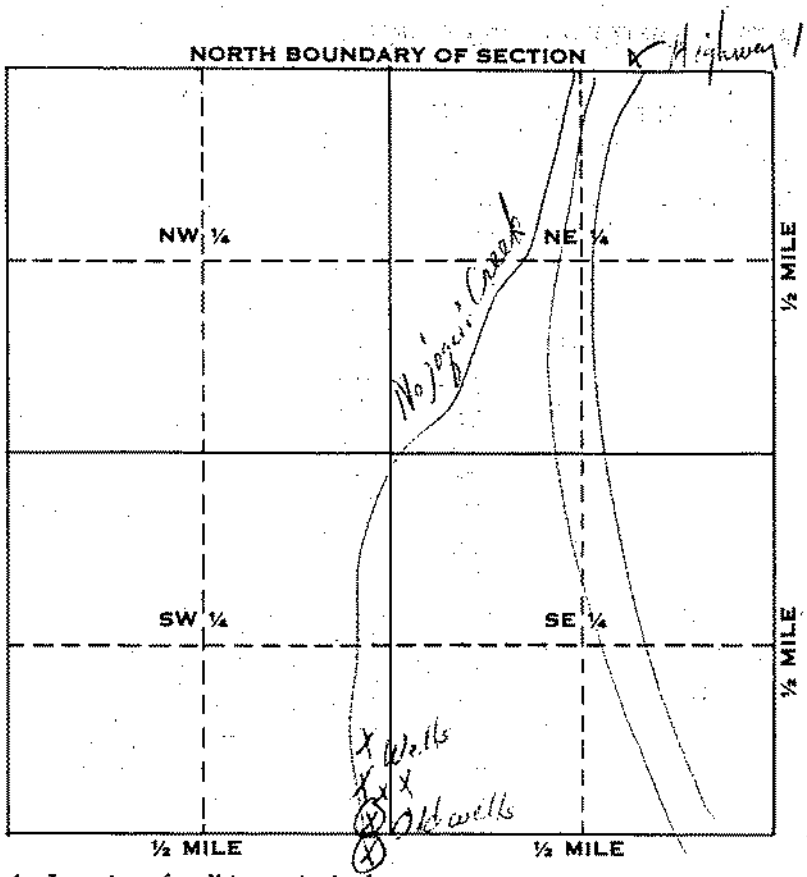
56391-950 10-65 50M TRIP ① △ OSP

38479

WELL LOCATION SKETCH



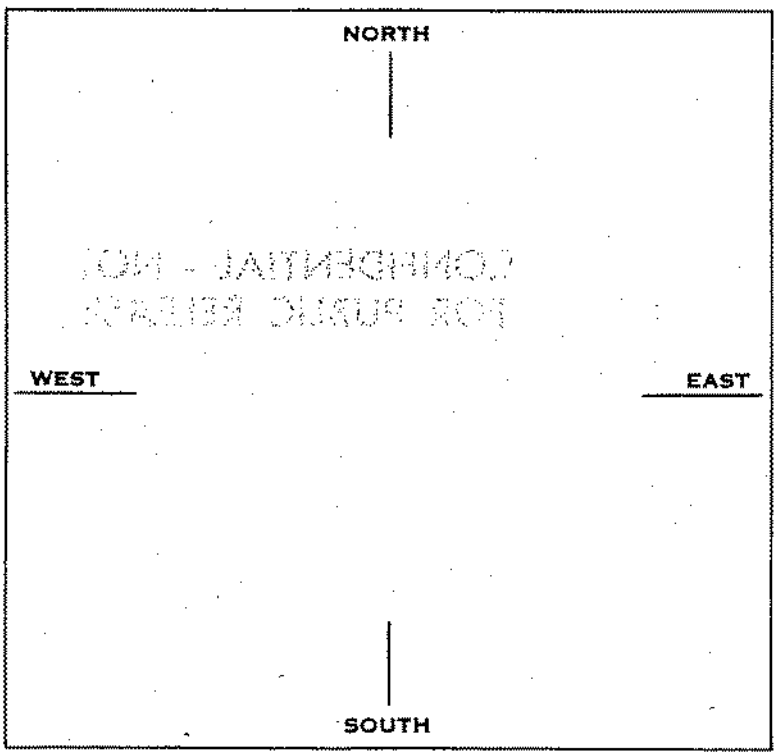
A. Location of well in sectionized areas.
Sketch roads, railroads, streams, or other features as necessary.

Township 6 N/S

Range 32 E/W

Section No. 24

950 ft N, 950 ft W of SE corner Section 36



B. Location of well in areas not sectionized.
Sketch roads, railroads, streams, or other features as necessary.
Indicate distances.

USGS 343309120113601 006N032W36R002S

Santa Barbara County, California
Hydrologic Unit Code 18060010
Latitude 34°33'09", Longitude 120°11'36" NAD27
Land-surface elevation 560.00 feet above NGVD29
The depth of the well is 47.0 feet below land surface.
The depth of the hole is 65.0 feet below land surface.
This well is completed in the Other aquifers (N9999OTHER) national aquifer.

Cachuma Resource Conservation District
920 E. Stowell Rd. Santa Maria, CA 93454
(805) 868-4013

January 3, 2022

To Whom It May Concern:

At this time the Cachuma Resource Conservation District has not conducted any watershed studies in the Nojoqui Creek area. We are not aware of the status of the watershed nor the availability of water, groundwater or surface.

Sincerely,

Anna Olsen
Executive Director
Cachuma Resource Conservation District

#	Date	Name	Comments	District?
1	1/13/2022 17:38	Ruby T		
2	1/21/2022 2:28	Ed Seaman		
3	1/25/2022 23:23	SPAM	SPAM	
4	1/27/2022 15:49	Lake Francis Mutual Water Company		
5	2/4/2022 14:23	Esther Schmitt		
6	2/11/2022 22:28	Katie Hershfelt		
7	3/14/2022 18:23	Kevin Rodriguez		
8	3/24/2022 22:23	Andy Busch	The Nojoquoi Corridor is not the right place for Commercial Cannabis. It is a stunning place meant for families and ranchers.	
9	3/28/2022 16:49	Shay Seaman		2
10	3/28/2022 23:37	Sierra Falso	Ditto on Andy Busch's comment, we feel the same. "The Nojoquoi Corridor is not the right place for Commercial Cannabis." As a resident of the Nojoquoi Corridor I also believe there is not enough. water to support commercial cannabis grows and the surrounding agriculture.	-3
11	3/29/2022 6:14	Ericka Buckley	Recreational â€œcropsâ€ take substantial and precious resources away from the community just so people can get high. That is unacceptable. Fact: Private â€œlegalâ€ grows are driving the black market causing more cartel traffic on our coastline. Nothing good about this in any way. I donâ€™t want more drugs being produced in my town, my neighborhood already reeks to the point that I cannot open the house at the end of a hot day. Also, I donâ€™t want my kids being exposed to the normalization of drug use.	
12	4/5/2022 4:28	Kurtis S	Please protect our local watershed	
13	4/5/2022 18:37	daniel corry		
14	4/6/2022 14:59	Paul Metzner	Santa Barbara cannabis operations apparently have surpassed the Emerald Triangle of N California. While we have numerous cannabis farms consisting of thousands of acres, we have only 1 U Pick berry farm with limited acreage for tourists and locals alike, especially young school and preschool children who love the experience and wholesome farm to table fruits. Please donâ€™t burden this special place with the demands of heightened traffic, security, odor and particularly the watershed during Californiaâ€™s protracted drought.	
15	4/7/2022 17:54	Manny Ayala	Please, stop destroying our beautiful back Country. This, proposal if approved will most definitely have a negative impact in the quality of life for all..	
16	4/7/2022 23:32	Randy Jones	We ran completely out of water from a well that worked for 80 years during the last drought when Nojoqui Farms raised Vegitables up the Nojoqui Creek from the Pork Palace. We do not irrigate but do raise livestock. We cannot afford to truck in water like we had to do the last time the creek went dry because of the excessive pumping and drought.	3

17	4/9/2022 17:49	Marion Seaman		
18	4/10/2022 5:35	Jill Stassinos	Please save our local watershed!	1
19	4/12/2022 3:53	Julie Churchman	I live in Santa Barbara and enjoy the bucolic setting of the Nojoqui Corridor. Please keep it free of ugly cannibis greenhouses and smells.	
20	4/13/2022 3:42	Linda Laskin	Santa Barbara does not need more cannabis farms. The little bit of water we do have should be used for growing fruits, vegetables, and water for the cattle as well as the beautiful oaks in the Nojoquoi Corridor. Water is a precious commodity, don't waste it on cannabis!	2
21	4/13/2022 23:54	Hanh Calkins		
22	4/14/2022 15:15	Pat Roberts	Please ban the growing of cannabis in the Nojoqui Falls corridor	-3
23	4/14/2022 18:33	Jay S Hinkle	Iâ€™m opposed to using this land for the cultivation of cannabis	
24	4/15/2022 3:19	Mia McElwee		24
25	4/15/2022 4:56	Katie Lekas	Please donâ€™t take away the beauty of this area by ruin the at with cannabis, smell alone will devastate the area. My children love this area and you were going to ruinous foul stench of cannabis. Not only that but the type of people that it brings are typically completely unsafe to be around children.	
26	4/15/2022 17:46	Vanessa Furlong		24
27	4/15/2022 19:38	John Furlong	Keep cannabis out! I don't know what district I'm in for SB (Goleta).	
28	4/16/2022 3:56	Betty Seaman	Time to respect and restore watersheds no matter the crop. Letâ€™s stop abusing the little remaining resources before we end up in the same shape as Cuyama valley, and other mono crop disaster areas.	3
29	4/16/2022 22:34	Rosemarie Harrison		93111
30	4/19/2022 14:53	Camron Baker		
31	4/19/2022 14:58	Kevin Shrout		
32	4/19/2022 15:55	Renata Brillinger		
33	4/19/2022 19:12	Allegra Roth	Keep groundwater available for food production!	
34	4/21/2022 15:09	Denice Fellows	The Nojoqui FallS Corridor is small and quaint. The traffic, noise, and smell that it would bring is in direct conflict with the beauty in the area. Please vote no!	-2
35	4/21/2022 15:53	Connie J Margolen		
36	4/21/2022 16:33	April Bancroft		
37	4/21/2022 16:53	Stuart Halewood		1
38	4/22/2022 17:08	Jennifer Walsh		5
39	4/23/2022 1:12	Randy Davis		
40	4/23/2022 13:12	Loretta Redd	How much cannabis needs to be produced for one relatively small community? This is a tax grab by local politicians.	4
41	4/23/2022 13:53	Susan Trenschel		

42	4/23/2022 14:28	Marcia Pearson	Caifornia may be entering a period of sustained drought. Prudent planning would seem to dictate that water would best be used for the natural ecosystem and edible crops.	2
43	4/23/2022 14:45	Dianne Burns	Nojoqui is a jewel. Enuf weed farms already. Per Joni Mitchel; "you don't know what you got till it's gone."	
44	4/23/2022 15:38	Clarinda CONGER	BAN COMMERCIAL CANNABIS IN SANTA BARBARA'S BEAUTIFUL NOJOQUI FALLS CORRIDOR	1
45	4/23/2022 16:34	GLEN MOWRER		-2
46	4/23/2022 17:20	Darcy Sylvester		5
47	4/23/2022 17:37	Marsha Croninger		1
48	4/23/2022 20:04	Anna Marie Gott		2
49	4/23/2022 20:26	Stephen Ferry	I've been visiting the Nojoqui Falls Corridor for over 50 years. It would be a shame to see it degraded by cannabis operations. As a minimum, the total watershed capacity should be measured and evaluated before any additional agricultural operations are approved.	2
50	4/23/2022 21:24	Jane Avon		4
51	4/23/2022 21:40	RW Ziegler Jr		
52	4/23/2022 21:50	Lorna Moore		4
53	4/24/2022 13:19	Mary Turley		2
54	4/24/2022 13:50	Nancy Leonard		
55	4/24/2022 14:14	Bernice James		2
56	4/24/2022 14:31	Dennis Houghton	We must all work to maintain the natural beauty of our open spaces. Hoop houses used in cannabis cultivation are an eyesore and the operation depletes our limited groundwater.	2
57	4/24/2022 14:33	Joe Selzler		2
58	4/24/2022 14:44	Ruth Green		
59	4/24/2022 15:13	Barbara Hirsch	Water, water, ecosystems!	2
60	4/25/2022 0:22	Ami Kearns		2
61	4/25/2022 0:26	Abel basch		
62	4/25/2022 2:27	Kerstin Corson		2
63	4/25/2022 12:40	Diane Huntoon		11
64	4/25/2022 15:54	Terry Hankenson	I am opposed to the cultivation the marijuana in the Nojocqui Falls watershed. This area needs to be preserved.	160
65	4/25/2022 18:14	Richard Schoonmaker		-4
66	4/25/2022 18:37	Hib Halverson		-1
67	4/25/2022 21:30	Judith McCaffrey	Please ban cannabis in the Nojoqui Falls corridor! We donâ€™t need more cannabis in Santa Barbara county!!	2
68	4/26/2022 2:32	douglas trantow		

69	4/27/2022 20:21	Cristy Christie	We cannot sustain increased water use pressure. This precious resource needs to be committed to our food systems.	
70	4/30/2022 20:43	Catherine Perman	Please protect this precious area and its ecosystem.	
71	5/2/2022 16:19	Katherine Carbone	Let's use our water wisely not approve additional projects that we don't have the water to sustain	4
72	5/4/2022 11:40	Kimberly Lisi		24
73	5/17/2022 19:48	Carrie Elizabeth Eacker		
74	5/18/2022 14:19	Denise Diven		
75	5/19/2022 0:58	James Diven		
76	5/23/2022 3:16	Cassandra Kashanski		
77	5/30/2022 15:35	Rachael Siebenaler	Letâ€™s preserve the water we have! And keep these beautiful places from stinking!

143	6/7/2022 4:18	Sabrina Barajas		
144	6/7/2022 4:19	Robert Texter	There are plenty of projects throughout the state I think one area without them would not hurt the state at all and I think because of the watershed and the needs of the people that are there already the projects should be banned	
145	6/7/2022 4:22	Anita La Fargo		
146	6/7/2022 4:23	Jamie Raye		
147	6/7/2022 4:24	Malisa Yee	Please ban commercial cannabis in Santa Barbara's Nojoqui Falls Corridor. Our family is concerned about the risk to the watershed and the environmental impact of having such a business in an ecologically sensitive area. Please do not approve the development of these large cannabis projects!	
148	6/7/2022 4:31	Courtnie Clegg		
149	6/7/2022 4:35	Jaelynne Lay		

150	6/7/2022 4:36	Gale Feldman	Most of CA is in the midst of a major drought. We have all been asked to cut our water usage significantly. To take resident efforts at conservation and offset that with large scale cannabis farming is ludacris. Cannabis farming requires a LOT of water either from stream diversion or wells. Well use by cannabis farms may contribute to long-term stream flow depletion. The current understanding of the interplay between well location, depth, and underlying geology on stream impacts is still in its infancy. Furthering understanding is not something that should be risked in the midst of historic drought. While some might argue that cannabis has minor medicinal benefit, it offers nothing that is crucial to survival - unlike farms that produce food. Please vote against allowing commercial cannabis farming in the Nojoqui Falls Corridor. (Personally I think the farms should be banned in all of California. Other states that aren't in the midst of drought are far better situated for optimal growing.)	
151	6/7/2022 4:41	Joan Schumacher	Ban cannibis!	
152	6/7/2022 4:46	Laura Putnam		
153	6/7/2022 4:48	Joe Howell		
154	6/7/2022 4:48	Tammy Gerenser	Just say NO. Enough is enough. Don't waste precious water on cannibis and don't ruin the beautiful valley.	2
155	6/7/2022 4:50	Christina Teich		2
156	6/7/2022 4:58	Carole MacKenzie		
157	6/7/2022 5:03	Mona Harnish	I am not against Cannabis, I make brownies with the leaves- but the farms do not need to be everywhere. One reason is the smell, another the water.	-2
158	6/7/2022 5:20	Alexa Fitch		
159	6/7/2022 5:59	Christopher Flacke	The points made in the petition about the unique qualities of the Nojoqui Falls corridor and its absolute unsuitability for water-intensive cultivation of cannabis (or any other crop) seems well-founded to me.	
160	6/7/2022 6:06	Anne Thomas		
161	6/7/2022 7:24	Tom

Subject: RE: SB County and State Water Board Discussion

Hi Joe,

That is an accurate and well-put summary of our discussion. I would add that our online database includes Statements of Diversion and Use, which are claims filed by water users. Those claims have not been affirmed by the State Water Board as surface water diversions. So, I would limit your second paragraph to water right permits, licenses, or registrations identified in our online database.

Also copied on this email is Philip Dutton, who oversees the Division of Water Rights' Registration Program.

Sam

Subject: RE: SB County and State Water Board Discussion

Hi Samuel,

I'm following up our meeting from last month and wanted to thank you for taking the time to chat with us. As discussed, we understand that SWRCB Water Rights Division does not wish to review all cannabis applications submitted to the County of Santa Barbara. We also understand from that discussion, that when a cannabis applicant utilizes a water well as a water source, the State presumes that the water is percolating groundwater, unless a specific determination has been previously made by the SWRCB's Board or a court.

We also discussed that there is no formal determination from the Water Board, or a court, regarding the Santa Ynez River, and therefore, wells nearby the River can be presumed to be using groundwater unless specifically identified on the Water Board's online database as a surface water diverter.

Could you please confirm that I've summarized this accurately? Thanks again – hope all is well with you.

Joe
