CONCLUSION	5

APPENDIX

- I. WATERSHED MAP
- II. RAINFALL CALCULATIONS

INTRODUCTION:

The Golden Inn project is located at the southeasterly corner of Mission Drive (Hwy 135) and Refugio Road in Santa Ynez, California. The site slopes toward an existing swale near the easterly 1/3 of the site then southerly. The site has an average slope of $5\% \pm$. Offsite drainage enters the site from an existing 24 inch culvert crossing Highway 246 (Mission Drive). The off-site storm water will pass through the site in an existing swale without detention. The swale will remain grass lined to allow some bio-filtration of the off-site water. The site is proposed to be developed as a senior care center. The project will include drainage basins to offset the increase peak runoff and to allow some groundwater recharge.

PROCEDURE:

Determine the existing runoff from the site prior to development. Collect the runoff form the developed portions of the site, rout the drainage through a detention basin with the outlet sized to allow no more than the existing flow to leave the site. Use the Santa Barbara Urban Hydrograph (SBUH) to determine the site runoff.

Site area is 7.34 acres. The easterly portion of the site will drain to a proposed basin on the east side of an existing drainage swale. The westerly portion of the site and some offsite drainage from Highway 246 will drain to a basin on the westerly side of the existing drainage swale. The existing site is soil type D, open land-good, use $cn=80$ for the existing condition. The portion of Highway 246 that will drain through the site is paved, use a $cn=98$. The total area draining through basin no. 1 will be 5.25 acres. Of this area 2.88 acres will be impervious post development. The total area draining through basin no. 2 will be 2.15 acres. Of this area 0.1 acres is impervious pre development and 1.14 acres will be impervious post development. For the impervious surface, use a $cn=98$, for the remaining pervious areas a $cn=80$. For areas with pervious and impervious portions calculate the cn value using a weighted average. Use a cn of 90 for area 1 post development. Use a cn of 81 for area 2 pre development and a cn of 90 for post developed.

Use a rainfall distribution for a 24 hour, Type 1 storm.

The drainage basin will serve two purposes. First the basins will have metered outlets to maintain the runoff in the post developed condition the same or less than in the existing condition. Second the basins will allow a portion of the drainage to have additional contact time with the soil to allow for infiltration of drainage into the soil.

Basins Provided:

Basin No. 1 is shown on shown on the preliminary grading plan on the easterly side of the existing drainage swale through the site. The bottom elevation is 593.0, the top elevation is 596.0, the lower outlet weir 1 has an elevation of 593.70 and has a width of 2.25 feet, the upper outlet weir has an elevation of 595.20 and has a width of 1.50 feet. This configuration will allow

Basin No. 1 to moderate the maximum flow leaving the basin to the same or less than the natural condition.

Basin No. 2 is shown on shown on the preliminary grading plan on the westerly side of the existing drainage swale through the site. The bottom elevation is 593.0, the top elevation is 596.0, the lower outlet weir has an elevation of 593.70 and has a width of 0.75 feet. The upper outlet weir has an elevation of 595.0 and has a width of 0.65 feet. This configuration will allow the Basin No. 2 to moderate the maximum flow leaving the basin to the same or less than the natural.

For a tabular representation of the basin flows see Table 1 below.

Table 1 Basin Summary

	Flow rates Q (cfs), Storage Volume V (cu. Ft.)					
	2yr	5yr	10yr	25yr	50yr	100yr
Basin No. 1						
Per-Developed runoff:	2.68	5.48	7.47	10.05	11.95	13.81
Post-Developed runoff:	7.61	12.55	15.79	19.82	22.72	25.53
Basin Outflow:	1.68	5.22	7.23	9.63	11.4	13.32
Basin WSE:	594.14	594.63	595.86	595.1	595.26	595.4
Basin Volume:	11,110	16,706	19,448	11,468	24,490	26,348
Basin No. 1						
Per-Developed runoff:	1.18	2.35	3.18	4.24	5.02	5.79
Post-Developed runoff:	6.07	5.08	6.39	8.03	9.21	10.35
Basin Outflow:	1.08	2.31	3.08	4.17	4.97	5.74
Basin WSE:	594.41	594.88	595.1	595.34	595.5	595.64
Basin Volume:	4,360	9,331	7,402	8,594	9,395	10,144

WATER QUALITY:

To extend the contact time of the drainage within the drainage basins set the low flow outlet 0.7 feet above the bottom of the basins. This will allow more contact time before the drainage exits the basins and will keep a percentage in the basin to infiltrate.

RECOMMENDATIONS:

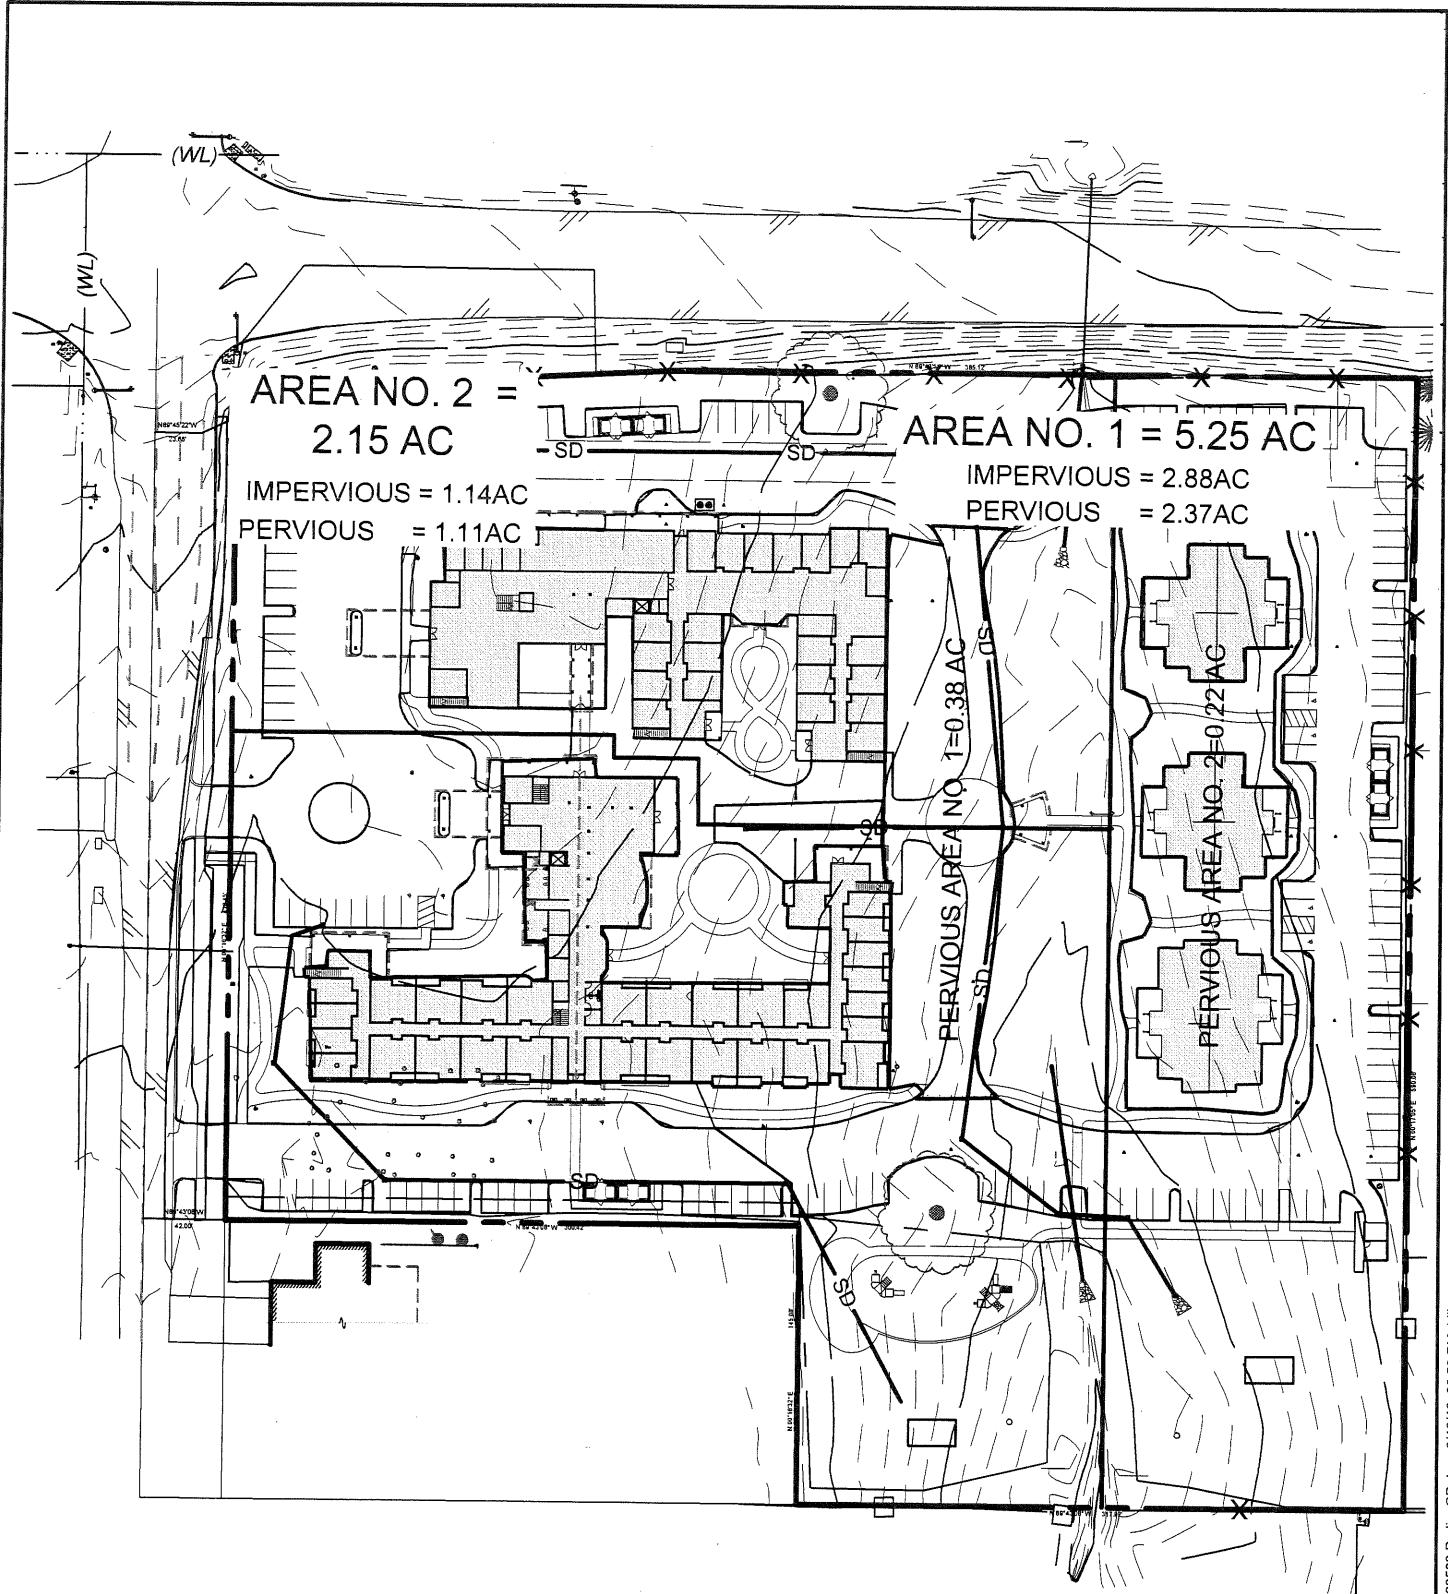

Install the drainage system to collect the runoff and pass it through the drainage basin as shown on the Preliminary Grading Plan. As much as reasonable allow the drainage from parking areas to pass through grass areas prior to entering the storm drain culverts. Use two basins as shown on the preliminary grading plan. Set the basin outlets above the bottom of the basins to allow for additional contact time for the drainage to infiltrate into the soil.

CONCLUSION:

The drainage basins described above and on the preliminary grading plan will retard the drainage flow out of the basin enough that the Post-Development flows leaving the site will be the same as or less than the existing peak flow from the Pre-Development condition. The basin will have a bottom elevation of 593.0 and a top of 596.0. The drainage basins will also allow for additional contact time between the drainage and the soil to encourage infiltration of the drainage into the soil.
